Title Estimation for some Reliability Distributions

Version 1.0.1

Description Parameters estimation and linear regression models for Reliability distributions families reviewed by Almalki & Nadarajah (2014) <[doi:10.1016/j.res.2013.11.010](https://doi.org/10.1016/j.res.2013.11.010)> using Generalized Additive Models for Location, Scale and Shape, GAMLSS by Rigby & Stasinopoulos (2005) <[doi:10.1111/j.1467-9876.2005.00510.x](https://doi.org/10.1111/j.1467-9876.2005.00510.x)>.

AddW

*The Additive Weibull family***Description**

The Additive Weibull distribution

Usage

```
AddW(mu.link = "log", sigma.link = "log", nu.link = "log", tau.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the sigma.
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the nu parameter.
<code>tau.link</code>	defines the <code>tau.link</code> , with "log" link as the default for the tau parameter.

Details

Additive Weibull distribution with parameters mu, sigma, nu and tau has density given by

$$f(x) = (\mu\nu x^{\nu-1} + \sigma\tau x^{\tau-1}) \exp(-\mu x^{\nu} - \sigma x^{\tau}),$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a AddW distribution in the `gamlss()` function.

## End(Not run)

```

Description

The Beta Generalized Exponentiated family

Usage

```
BGE(mu.link = "log", sigma.link = "log", nu.link = "log", tau.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the sigma.
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the nu parameter.
<code>tau.link</code>	defines the <code>tau.link</code> , with "log" link as the default for the tau parameter.

Details

The Beta Generalized Exponentiated distribution with parameters `mu`, `sigma`, `nu` and `tau` has density given by

$$f(x) = \frac{\nu\tau}{B(\mu,\sigma)} \exp(-\nu x)(1 - \exp(-\nu x))^{\tau\mu-1}(1 - (1 - \exp(-\nu x))^{\tau})^{\sigma-1},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$, $\nu > 0$ and $\tau > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a BGE distribution in the `gamlss()` function.

BS

The Birnbaum-Saunders family

Description

The function `BS()` defines The Birnbaum-Saunders, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
BS(mu.link = "log", sigma.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the sigma.

Details

The Birnbaum-Saunders with parameters μ and σ has density given by

$$f(x|\mu, \sigma) = \frac{x^{-3/2}(x+\mu)}{2\sigma\sqrt{2\pi\mu}} \exp\left(\frac{-1}{2\sigma^2}\left(\frac{x}{\mu} + \frac{\mu}{x} - 2\right)\right)$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$. In this parameterization μ is the median of X , $E(X) = \mu(1 + \sigma^2/2)$ and $Var(X) = (\mu\sigma)^2(1 + 5\sigma^2/4)$. The functions proposed here corresponds to the functions created by Roquim et al. (2021) with minor modifications to obtain correct log-likelihoods and random samples.

Value

Returns a `gamlss.family` object which can be used to fit a BS distribution in the `gamlss()` function.

 BS2

The Birnbaum-Saunders family - Santos-Neto et al. (2014)

Description

The function `BS2()` defines The Birnbaum-Saunders, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
BS2(mu.link = "log", sigma.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the mu parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the sigma.

Details

The Birnbaum-Saunders with parameters `mu` and `sigma` has density given by

$$f(x|\mu, \sigma) = \frac{\exp(\sigma/2)\sqrt{\sigma+1}}{4\sqrt{\pi}\mu x^{3/2}} \left[x + \frac{\mu\sigma}{\sigma+1} \right] \exp\left(\frac{-\sigma}{4} \left(\frac{x(\sigma+1)}{\mu\sigma} + \frac{\mu\sigma}{x(\sigma+1)} \right)\right)$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$. In this parameterization $E(X) = \mu$ and $Var(X) = \frac{\mu^2(2\sigma+5)}{(\sigma+1)^2}$.

Value

Returns a `gamlss.family` object which can be used to fit a BS2 distribution in the `gamlss()` function.

# Extracting the fitted values for mu and sigma
# using the inverse link function
exp(coef(mod4, what="mu"))
exp(coef(mod4, what="sigma"))

```

Description

The function `BS3()` defines The Birnbaum-Saunders, a two parameter distribution, for a `gamlss` family object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
BS3(mu.link = "log", sigma.link = "logit")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "logit" link as the default for the `sigma`.

Details

The Birnbaum-Saunders with parameters `mu` and `sigma` has density given by

$$f(x|\mu, \sigma) = \frac{(1-\sigma)y+\mu}{2\sqrt{2\pi\mu\sigma(1-\sigma)y^{3/2}}} \exp\left[\frac{-1}{2\sigma}\left(\frac{(1-\sigma)y}{\mu} + \frac{\mu}{(1-\sigma)y} - 2\right)\right]$$

for $x > 0$, $\mu > 0$ and $0 < \sigma < 1$. In this parameterization $Mode(X) = \mu$ and $Var(X) = (\mu\sigma)^2(1 + 5\sigma^2/4)$.

Value

Returns a `gamlss.family` object which can be used to fit a BS3 distribution in the `gamlss()` function.

CJ2

The two-parameter Chris-Jerry distribution family

Description

The function `CJ2()` defines The two-parameter Chris-Jerry distribution, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
CJ2(mu.link = "log", sigma.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.

Details

The two-parameter Chris-Jerry distribution with parameters `mu` and `sigma` has density given by

$$f(x; \sigma, \mu) = \frac{\mu^2}{\sigma\mu+2}(\sigma + \mu x^2)e^{-\mu x}; \quad x > 0, \quad \mu > 0, \quad \sigma > 0$$

Note: In this implementation we changed the original parameters θ for μ and λ for σ we did it to implement this distribution within `gamlss` framework.

Value

Returns a `gamlss.family` object which can be used to fit a CJ2 distribution in the `gamlss()` function.

summary(mod2)
```

Description

The Cosine Sine Exponential family

Usage

```
CS2e(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.
`nu.link` defines the `nu.link`, with "log" link as the default for the `nu` parameter.

Details

The Cosine Sine Exponential distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \frac{\pi \sigma \mu \exp(\frac{-x}{\nu})}{2\nu[(\mu \sin(\frac{\pi}{2} \exp(\frac{-x}{\nu})) + \sigma \cos(\frac{\pi}{2} \exp(\frac{-x}{\nu})))^2]}$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a CS2e distribution in the `gamlss()` function.

dAddW

The Additive Weibull distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Additive Weibull distribution with parameters μ , σ , ν and τ .

Usage

```
dAddW(x, mu, sigma, nu, tau, log = FALSE)
```

```
pAddW(q, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)
```

```
qAddW(p, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)
```

```
rAddW(n, mu, sigma, nu, tau)
```

```
hAddW(x, mu, sigma, nu, tau)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	shape parameter.
tau	shape parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

Additive Weibull Distribution with parameters mu, sigma, nu and tau has density given by

$$f(x) = (\mu\nu x^{\nu-1} + \sigma\tau x^{\tau-1}) \exp(-\mu x^{\nu} - \sigma x^{\tau}),$$

for $x > 0$.

Value

dAddW gives the density, pAddW gives the distribution function, qAddW gives the quantile function, rAddW generates random deviates and hAddW gives the hazard function.

dBGE

*The Beta Generalized Exponentiated distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Beta Generalized Exponentiated distribution with parameters μ , σ , ν and τ .

Usage

```

dBGE(x, mu, sigma, nu, tau, log = FALSE)

pBGE(q, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

qBGE(p, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

```

rBGE(n, mu, sigma, nu, tau)

hBGE(x, mu, sigma, nu, tau)

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	parameter.
tau	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Beta Generalized Exponentiated Distribution with parameters mu, sigma, nu and tau has density given by

$$f(x) = \frac{\nu\tau}{B(\mu,\sigma)} \exp(-\nu x)(1 - \exp(-\nu x))^{\tau\mu-1}(1 - (1 - \exp(-\nu x))^{\tau})^{\sigma-1},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$, $\nu > 0$ and $\tau > 0$.

Value

dBGE gives the density, pBGE gives the distribution function, qBGE gives the quantile function, rBGE generates random deviates and hBGE gives the hazard function.

```

Description

Density, distribution function, quantile function, random generation and hazard function for the Birnbaum-Saunders distribution with parameters μ and σ .

Usage

```

dBS(x, mu = 1, sigma = 1, log = FALSE)

pBS(q, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

qBS(p, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

```

rBS(n, mu = 1, sigma = 1)

hBS(x, mu, sigma)

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Birnbaum-Saunders with parameters mu and sigma has density given by

$$f(x|\mu, \sigma) = \frac{x^{-3/2}(x+\mu)}{2\sigma\sqrt{2\pi\mu}} \exp\left(\frac{-1}{2\sigma^2}\left(\frac{x}{\mu} + \frac{\mu}{x} - 2\right)\right)$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$. In this parameterization μ is the median of X , $E(X) = \mu(1 + \sigma^2/2)$ and $Var(X) = (\mu\sigma)^2(1 + 5\sigma^2/4)$. The functions proposed here corresponds to the functions created by Roquim et al. (2021) with minor modifications to obtain correct log-likelihoods and random samples.

Value

dBS gives the density, pBS gives the distribution function, qBS gives the quantile function, rBS generates random deviates and hBS gives the hazard function.

Description

Density, distribution function, quantile function, random generation and hazard function for the Birnbaum-Saunders distribution with parameters μ and σ .

Usage

```

dBS2(x, mu = 1, sigma = 1, log = FALSE)

pBS2(q, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

qBS2(p, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)

rBS2(n, mu = 1, sigma = 1)

hBS2(x, mu, sigma)

```

Arguments

x, q	vector of quantiles.
mu	parameter.

sigma	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Birnbaum-Saunders with parameters μ and σ has density given by

$$f(x) = \frac{\exp(\sigma/2)\sqrt{\sigma+1}}{4\sqrt{\pi}\mu x^{3/2}} \left[x + \frac{\mu\sigma}{\sigma+1} \right] \exp\left(\frac{-\sigma}{4} \left(\frac{x(\sigma+1)}{\mu\sigma} + \frac{\mu\sigma}{x(\sigma+1)} \right)\right)$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$. In this parameterization $E(X) = \mu$ and $Var(X) = (\mu\sigma)^2(1+5\sigma^2/4)$. The functions proposed here corresponds to the parameterization proposed by Santos-Neto et al. (2014).

Value

dBS2 gives the density, pBS2 gives the distribution function, qBS2 gives the quantile function, rBS2 generates random deviates and hBS2 gives the hazard function.

dBS3

*The Birnbaum-Saunders distribution - Bourguignon & Gallardo
(2022)*

Description

Density, distribution function, quantile function, random generation and hazard function for the Birnbaum-Saunders distribution with parameters μ and σ .

Usage

```
dBS3(x, mu = 1, sigma = 0.5, log = FALSE)

pBS3(q, mu = 1, sigma = 0.5, lower.tail = TRUE, log.p = FALSE)

qBS3(p, mu = 1, sigma = 0.5, lower.tail = TRUE, log.p = FALSE)

rBS3(n, mu = 1, sigma = 0.5)

hBS3(x, mu, sigma)
```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Birnbaum-Saunders with parameters μ and σ has density given by

$$f(x) = \frac{\exp(\sigma/2)\sqrt{\sigma+1}}{4\sqrt{\pi}\mu x^{3/2}} \left[x + \frac{\mu\sigma}{\sigma+1} \right] \exp\left(\frac{-\sigma}{4} \left(\frac{x(\sigma+1)}{\mu\sigma} + \frac{\mu\sigma}{x(\sigma+1)} \right)\right)$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$. In this parameterization $E(X) = \mu$ and $Var(X) = (\mu\sigma)^2(1+5\sigma^2/4)$. The functions proposed here corresponds to the parameterization proposed by Santos-Neto et al. (2014).

Value

dBS3 gives the density, pBS3 gives the distribution function, qBS3 gives the quantile function, rBS3 generates random deviates and hBS3 gives the hazard function.

dCJ2

The two-parameter Chris-Jerry distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the two-parameter Chris-Jerry distribution with parameters μ and σ .

Usage

```

dCJ2(x, mu, sigma, log = FALSE)

pCJ2(q, mu, sigma, log.p = FALSE, lower.tail = TRUE)

qCJ2(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)

rCJ2(n, mu, sigma)

hCJ2(x, mu, sigma, log = FALSE)

```

Arguments

x, q vector of quantiles.

mu	parameter.
sigma	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The two-parameter Chris-Jerry distribution with parameters mu and sigma has density given by

$$f(x; \sigma, \mu) = \frac{\mu^2}{\sigma\mu+2}(\sigma + \mu x^2)e^{-\mu x}; \quad x > 0, \quad \mu > 0, \quad \sigma > 0$$

Note: In this implementation we changed the original parameters θ for μ and λ for σ , we did it to implement this distribution within gamlss framework.

Value

dCJ2 gives the density, pCJ2 gives the distribution function, qCJ2 gives the quantile function, rCJ2 generates random deviates and hCJ2 gives the hazard function.

dCS2e

The Cosine Sine Exponential distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Cosine Sine Exponential distribution with parameters μ , σ and ν .

Usage

```

dCS2e(x, mu, sigma, nu, log = FALSE)

pCS2e(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qCS2e(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rCS2e(n, mu, sigma, nu)

hCS2e(x, mu, sigma, nu)

```

Arguments

x, q vector of quantiles.

mu	parameter.
sigma	parameter.
nu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Cosine Sine Exponential Distribution with parameters mu, sigma and nu has density given by

$$f(x) = \frac{\pi \sigma \mu \exp\left(\frac{-x}{\nu}\right)}{2\nu[(\mu \sin\left(\frac{\pi}{2} \exp\left(\frac{-x}{\nu}\right)\right) + \sigma \cos\left(\frac{\pi}{2} \exp\left(\frac{-x}{\nu}\right)\right)]^2},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

dCS2e gives the density, pCS2e gives the distribution function, qCS2e gives the quantile function, rCS2e generates random deviates and hCS2e gives the hazard function.

dEEG

The Extended Exponential Geometric distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Extended Exponential Geometric distribution with parameters μ and σ .

Usage

```

dEEG(x, mu, sigma, log = FALSE)

pEEG(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)

qEEG(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)

rEEG(n, mu, sigma)

hEEG(x, mu, sigma)

```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Extended Exponential Geometric distribution with parameters μ , and σ has density given by

$$f(x) = \mu\sigma \exp(-\mu x)(1 - (1 - \sigma) \exp(-\mu x))^{-2},$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$.

Value

dEEG gives the density, pEEG gives the distribution function, qEEG gives the quantile function, rEEG generates random deviates and hEEG gives the hazard function.

dEGG

The four parameter Exponentiated Generalized Gamma distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the four parameter Exponentiated Generalized Gamma distribution with parameters μ , σ , ν and τ .

Usage

```

dEGG(x, mu, sigma, nu, tau, log = FALSE)

pEGG(q, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

qEGG(p, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

rEGG(n, mu, sigma, nu, tau)

hEGG(x, mu, sigma, nu, tau)

```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>nu</code>	parameter.
<code>tau</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

Four-Parameter Exponentiated Generalized Gamma distribution with parameters μ , σ , ν and τ has density given by

$$f(x) = \frac{\nu\sigma}{\mu\Gamma(\tau)} \left(\frac{x}{\mu}\right)^{\sigma\tau-1} \exp\left\{-\left(\frac{x}{\mu}\right)^\sigma\right\} \left\{\gamma_1\left(\tau, \left(\frac{x}{\mu}\right)^\sigma\right)\right\}^{\nu-1},$$

for $x > 0$.

Value

dEGG gives the density, pEGG gives the distribution function, qEGG gives the quantile function, rEGG generates random deviates and hEGG gives the hazard function.

dEMWEx

*The Exponentiated Modified Weibull Extension distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Exponentiated Modified Weibull Extension distribution with parameters μ , σ , ν and τ .

Usage

```
dEMWEx(x, mu, sigma, nu, tau, log = FALSE)

pEMWEx(q, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

qEMWEx(p, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

rEMWEx(n, mu, sigma, nu, tau)

hEMWEx(x, mu, sigma, nu, tau)
```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>nu</code>	parameter.
<code>tau</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Exponentiated Modified Weibull Extension Distribution with parameters μ , σ , ν and τ has density given by

$$f(x) = \nu\sigma\tau\left(\frac{x}{\mu}\right)^{\sigma-1} \exp\left(\left(\frac{x}{\mu}\right)^{\sigma} + \nu\mu(1 - \exp\left(\left(\frac{x}{\mu}\right)^{\sigma}\right))\right)(1 - \exp(\nu\mu(1 - \exp\left(\left(\frac{x}{\mu}\right)^{\sigma}\right))))^{\tau-1},$$

for $x > 0$, $\nu > 0$, $\mu > 0$, $\sigma > 0$ and $\tau > 0$.

Value

dEMWEx gives the density, pEMWEx gives the distribution function, qEMWEx gives the quantile function, rEMWEx generates random deviates and hEMWEx gives the hazard function.

dEOFNH

*The Extended Odd Frechet-Nadarajah-Haghighi***Description**

Density, distribution function, quantile function, random generation and hazard function for the Extended Odd Frchet-Nadarajah-Haghighi distribution with parameters μ , σ , ν and τ .

Usage

```

dEOFNH(x, mu, sigma, nu, tau, log = FALSE)

pEOFNH(q, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

qEOFNH(p, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

rEOFNH(n, mu, sigma, nu, tau)

hEOFNH(x, mu, sigma, nu, tau)

```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>nu</code>	parameter.
<code>tau</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Extended Odd Fréchet-Nadarajah-Haghighi μ , σ , ν and τ has density given by

$$f(x) = \frac{\mu\sigma\nu\tau(1+\nu x)^{\sigma-1}e^{(1-(1+\nu x)^\sigma)}[1-(1-e^{(1-(1+\nu x)^\sigma)})^\mu]^{\tau-1}}{(1-e^{(1-(1+\nu x)^\sigma)})^{\mu\tau+1}}e^{-[(1-e^{(1-(1+\nu x)^\sigma)})^{-\mu}-1]^\tau},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$, $\nu > 0$ and $\tau > 0$.

Value

dEOFNH gives the density, pEOFNH gives the distribution function, qEOFNH gives the quantile function, rEOFNH generates random numbers and hEOFNH gives the hazard function.

par(old_par) # restore previous graphical parameters
```

Description

Density, distribution function, quantile function, random generation and hazard function for the exponentiated XLindley distribution with parameters μ and σ .

Usage

```
dEXL(x, mu, sigma, log = FALSE)

pEXL(q, mu, sigma, log.p = FALSE, lower.tail = TRUE)

qEXL(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)

rEXL(n, mu, sigma)

hEXL(x, mu, sigma, log = FALSE)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The exponentiated XLindley with parameters μ and σ has density given by

$$f(x) = \frac{\sigma\mu^2(2+\mu+x)\exp(-\mu x)}{(1+\mu)^2} \left[1 - \left(1 + \frac{\mu x}{(1+\mu)^2} \right) \exp(-\mu x) \right]^{\sigma-1}$$

for $x \geq 0$, $\mu \geq 0$ and $\sigma \geq 0$.

Note: In this implementation we changed the original parameters δ for μ and α for σ , we did it to implement this distribution within gamlss framework.

Value

dEXL gives the density, pEXL gives the distribution function, qEXL gives the quantile function, rEXL generates random deviates and hEXL gives the hazard function.

dExW

The Extended Weibull distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Extended Weibull distribution with parameters μ , σ and ν .

Usage

```

dExW(x, mu, sigma, nu, log = FALSE)

pExW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qExW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rExW(n, mu, sigma, nu)

hExW(x, mu, sigma, nu)

```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>nu</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Extended Weibull distribution with parameters μ , σ and ν has density given by

$$f(x) = \frac{\mu \sigma \nu x^{\sigma-1} \exp(-\mu x^\sigma)}{[1 - (1-\nu) \exp(-\mu x^\sigma)]^2},$$

for $x > 0$.

Value

dExW gives the density, pExW gives the distribution function, qExW gives the quantile function, rExW generates random deviates and hExW gives the hazard function.

dExWALD

The Ex-Wald distribution

Description

These functions define the density, distribution function, quantile function and random generation for the Ex-Wald distribution with parameter μ , σ and ν .

Usage

```
dExWALD(x, mu = 1.5, sigma = 1.5, nu = 2, log = FALSE)
```

```
pExWALD(q, mu = 1.5, sigma = 1.5, nu = 2, lower.tail = TRUE, log.p = FALSE)
```

```
qExWALD(p, mu = 1.5, sigma = 1.5, nu = 2)
```

```
rExWALD(n, mu = 1.5, sigma = 1.5, nu = 2)
```

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of the mu parameter.
sigma	vector of the sigma parameter.
nu	vector of the nu parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of random values to return.

Details

The Wald distribution with parameters μ , σ and ν has density given by

$$f(x|\mu, \sigma, \nu) = \frac{1}{\nu} \exp\left(\frac{-x}{\nu} + \sigma(\mu - k)\right) F_W(x|k, \sigma) \text{ for } k \geq 0$$

$$f(x|\mu, \sigma, \nu) = \frac{1}{\nu} \exp\left(\frac{-(\sigma - \mu)^2}{2x}\right) \operatorname{Re}\left(w\left(k' \sqrt{x/2} + \frac{\sigma i}{\sqrt{2x}}\right)\right) \text{ for } k < 0$$

where $k = \sqrt{\mu^2 - \frac{2}{\nu}}$, $k' = \sqrt{\frac{2}{\nu} - \mu^2}$ and F_W corresponds to the cumulative function of the Wald distribution.

More details about those expressions can be found on page 680 from Heathcote (2004).

Value

dExWALD gives the density, pExWALD gives the distribution function, qExWALD gives the quantile function, rExWALD generates random deviates.

```

Description

Density, distribution function, quantile function, random generation and hazard function for the Flexible Weibull Extension distribution with parameters μ and σ .

Usage

```
dFWE(x, mu, sigma, log = FALSE)
```

```
pFWE(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)
```

```
qFWE(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)
```

```
rFWE(n, mu, sigma)
```

```
hFWE(x, mu, sigma)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Flexible Weibull extension with parameters `mu` and `sigma` has density given by

$$f(x) = (\mu + \sigma/x^2) \exp(\mu x - \sigma/x) \exp(-\exp(\mu x - \sigma/x))$$

for $x > 0$.

Value

dFWE gives the density, pFWE gives the distribution function, qFWE gives the quantile function, rFWE generates random deviates and hFWE gives the hazard function.

dGammaW

The Gamma Weibull distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Gamma Weibull distribution with parameters μ , σ , ν and τ .

Usage

```
dGammaW(x, mu, sigma, nu, log = FALSE)

pGammaW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qGammaW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rGammaW(n, mu, sigma, nu)

hGammaW(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
μ	parameter.
σ	parameter.
ν	parameter.
$\log, \log.p$	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of observations.

Details

The Gamma Weibull Distribution with parameters μ , σ and ν has density given by

$$f(x) = \frac{\sigma \mu^\nu}{\Gamma(\nu)} x^{\nu\sigma-1} \exp(-\mu x^\sigma),$$

for $x > 0$, $\mu > 0$, $\sigma \geq 0$ and $\nu > 0$.

Value

dGammaW gives the density, pGammaW gives the distribution function, qGammaW gives the quantile function, rGammaW generates random deviates and hGammaW gives the hazard function.

dGGD

The Generalized Gompertz distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the generalized Gompertz distribution with parameters μ σ and ν .

Usage

```

dGGD(x, mu, sigma, nu, log = FALSE)

pGGD(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qGGD(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rGGD(n, mu, sigma, nu)

hGGD(x, mu, sigma, nu)

```

Arguments

x, q	vector of quantiles.
μ, ν	scale parameter.
σ	shape parameters.
$\log, \log.p$	logical; if TRUE, probabilities p are given as $\log(p)$.
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of observations.

Details

The Generalized Gompertz Distribution with parameters μ , σ and ν has density given by

$$f(x) = \nu\mu \exp\left(-\frac{\mu}{\sigma}(\exp(\sigma x - 1))\right) \left(1 - \exp\left(-\frac{\mu}{\sigma}(\exp(\sigma x - 1))\right)\right)^{(\nu-1)},$$

for $x \geq 0$, $\mu > 0$, $\sigma \geq 0$ and $\nu > 0$.

Value

dGGD gives the density, pGGD gives the distribution function, qGGD gives the quantile function, rGGD generates random deviates and hGGD gives the hazard function.

dGIW

*The Generalized Inverse Weibull distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Generalized Inverse Weibull distribution with parameters μ , σ and ν .

Usage

```
dGIW(x, mu, sigma, nu, log = FALSE)
pGIW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
qGIW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
rGIW(n, mu, sigma, nu)
hGIW(x, mu, sigma, nu)
```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>nu</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Generalized Inverse Weibull distribution μ , σ and ν has density given by

$$f(x) = \nu \sigma \mu^\sigma x^{-(\sigma+1)} \exp\left\{-\nu \left(\frac{\mu}{x}\right)^\sigma\right\},$$

for $x > 0$.

Value

dGIW gives the density, pGIW gives the distribution function, qGIW gives the quantile function, rGIW generates random deviates and hGIW gives the hazard function.

hGMW(x, mu, sigma, nu, tau, log = FALSE)
```

Arguments

x, q	vector of quantiles.
mu	scale parameter.
sigma	shape parameter.
nu	shape parameter.
tau	acceleration parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The generalized modified weibull with parameters mu, sigma, nu and tau has density given by

$$f(x) = \mu\sigma x^{\nu-1}(\nu + \tau x) \exp(\tau x - \mu x^{\nu} e^{\tau x}) [1 - \exp(-\mu x^{\nu} e^{\tau x})]^{\sigma-1},$$

for $x > 0$.

Value

dGMW gives the density, pGMW gives the distribution function, qGMW gives the quantile function, rGMW generates random deviates and hGMW gives the hazard function.

dGWF

Generalized Weibull distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the generalized Weibull distribution with parameters μ , σ and ν .

Usage

```

dGWF(x, mu, sigma, nu, log = FALSE)

pGWF(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qGWF(p, mu, sigma, nu)

rGWF(n, mu, sigma, nu)

```

```
hGWF(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	parameter one.
sigma	parameter two.
nu	parameter three.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The generalized Weibull with parameters mu, sigma and nu has density given by

$$f(x) = \mu\sigma x^{\sigma-1} (1 - \mu\nu x^\sigma)^{\frac{1}{\nu}-1}$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $-\infty < \nu < \infty$.

Value

dGWF gives the density, pGWF gives the distribution function, qGWF gives the quantile function, rGWF generates random deviates and hGWF gives the hazard function.

)

par(old_par) # restore previous graphical parameters

```

Description

Density, distribution function, quantile function, random generation and hazard function for the inverse weibull distribution with parameters μ and σ .

Usage

```
dIW(x, mu, sigma, log = FALSE)

pIW(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)

qIW(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)

rIW(n, mu, sigma)

hIW(x, mu, sigma)
```

Arguments

x, q	vector of quantiles.
mu	scale parameter.
sigma	shape parameters.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The inverse weibull distribution with parameters mu and sigma has density given by

$$f(x) = \mu\sigma x^{-\sigma-1} \exp(\mu x^{-\sigma})$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$

Value

dIW gives the density, pIW gives the distribution function, qIW gives the quantile function, rIW generates random deviates and hIW gives the hazard function.

dKumIW

*The Kumaraswamy Inverse Weibull distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Kumaraswamy Inverse Weibull distribution with parameters μ , σ and ν .

Usage

```

dKumIW(x, mu, sigma, nu, log = FALSE)

pKumIW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qKumIW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rKumIW(n, mu, sigma, nu)

```

hKumIW(x, mu, sigma, nu)

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Kumaraswamy Inverse Weibull Distribution with parameters mu, sigma and nu has density given by

$$f(x) = \mu\sigma\nu x^{-\mu-1} \exp -\sigma x^{-\mu} (1 - \exp -\sigma x^{-\mu})^{\nu-1},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

dKumIW gives the density, pKumIW gives the distribution function, qKumIW gives the quantile function, rKumIW generates random deviates and hKumIW gives the hazard function.

dLIN

*Lindley distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Lindley distribution with parameter μ .

Usage

```
dLIN(x, mu, log = FALSE)
```

```
pLIN(q, mu, lower.tail = TRUE, log.p = FALSE)
```

```
qLIN(p, mu, lower.tail = TRUE, log.p = FALSE)
```

```
rLIN(n, mu)
```

```
hLIN(x, mu, log = FALSE)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

Lindley Distribution with parameter mu has density given by

$$f(x) = \frac{\mu^2}{\mu+1}(1+x)\exp(-\mu x),$$

for $x > 0$ and $\mu > 0$. These function were taken form LindleyR package.

Value

dLIN gives the density, pLIN gives the distribution function, qLIN gives the quantile function, rLIN generates random deviates and hLIN gives the hazard function.

dLW

*The Log-Weibull distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Log-Weibull distribution with parameters μ and σ .

Usage

```

dLW(x, mu, sigma, log = FALSE)

pLW(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)

qLW(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)

rLW(n, mu, sigma)

hLW(x, mu, sigma)

```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Log-Weibull Distribution with parameters μ and σ has density given by

$$f(y) = (1/\sigma)e^{((y-\mu)/\sigma)} \exp\{-e^{((y-\mu)/\sigma)}\},$$

for $-\infty < y < \infty$.

Value

dLW gives the density, pLW gives the distribution function, qLW gives the quantile function, rLW generates random deviates and hLW gives the hazard function.

dMOEIW

The Marshall-Olkin Extended Inverse Weibull distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Marshall-Olkin Extended Inverse Weibull distribution with parameters μ , σ and ν .

Usage

```
dMOEIW(x, mu, sigma, nu, log = FALSE)

pMOEIW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qMOEIW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rMOEIW(n, mu, sigma, nu)

hMOEIW(x, mu, sigma, nu)
```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>nu</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Marshall-Olkin Extended Inverse Weibull distribution μ , σ and ν has density given by

$$f(x) = \frac{\mu \sigma \nu x^{-(\sigma+1)} \exp\{-\mu x^{-\sigma}\}}{\{\nu - (\nu-1) \exp\{-\mu x^{-\sigma}\}\}^2},$$

for $x > 0$.

Value

dMOEIW gives the density, pMOEIW gives the distribution function, qMOEIW gives the quantile function, rMOEIW generates random deviates and hMOEIW gives the hazard function.

dMOEW

*The Marshall-Olkin Extended Weibull distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Marshall-Olkin Extended Weibull distribution with parameters mu, sigma and nu.

Usage

```
dMOEW(x, mu, sigma, nu, log = FALSE)
```

```
pMOEW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
qMOEW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
rMOEW(n, mu, sigma, nu)
```

```
hMOEW(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Marshall-Olkin Extended Weibull distribution mu, sigma and nu has density given by

$$f(x) = \frac{\mu\sigma\nu(\nu x)^{\sigma-1} \exp\{-(\nu x)^\sigma\}}{\{1-(1-\mu)\exp\{-(\nu x)^\sigma\}\}^2},$$

for $x > 0$.

Value

dMOEW gives the density, pMOEW gives the distribution function, qMOEW gives the quantile function, rMOEW generates random deviates and hMOEW gives the hazard function.

Description

Density, distribution function, quantile function, random generation and hazard function for the Marshall-Olkin Kappa distribution with parameters μ , σ , ν and τ .

Usage

```
dMOK(x, mu, sigma, nu, tau, log = FALSE)

pMOK(q, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

qMOK(p, mu, sigma, nu, tau, lower.tail = TRUE, log.p = FALSE)

rMOK(n, mu, sigma, nu, tau)

hMOK(x, mu, sigma, nu, tau)
```

Arguments

x, q	vector of quantiles.
μ	parameter.
σ	parameter.
ν	parameter.
τ	parameter.
$\log, \log.p$	logical; if TRUE, probabilities p are given as $\log(p)$.
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of observations.

Details

The Marshall-Olkin Kappa distribution with parameters μ , σ , ν and τ has density given by:

$$f(x) = \frac{\tau \frac{\mu\nu}{\sigma} \left(\frac{x}{\sigma}\right)^{\nu-1} \left(\mu + \left(\frac{x}{\sigma}\right)^{\mu\nu}\right)^{-\frac{\mu+1}{\mu}}}{\left[\tau + (1-\tau) \left(\frac{\left(\frac{x}{\sigma}\right)^{\mu\nu}}{\mu + \left(\frac{x}{\sigma}\right)^{\mu\nu}}\right)^{\frac{1}{\mu}}\right]^2}$$

for $x > 0$.

Value

dMOK gives the density, pMOK gives the distribution function, qMOK gives the quantile function, rMOK generates random deviates and hMOK gives the hazard function.

Details

The modified weibull distribution with parameters μ , σ and ν has density given by

$$f(x) = \mu(\sigma + \nu x)x^{\sigma-1} \exp(\nu x) \exp(-\mu x^\sigma \exp(\nu x))$$

for $x > 0$, $\mu > 0$, $\sigma \geq 0$ and $\nu \geq 0$.

Value

`dMW` gives the density, `pMW` gives the distribution function, `qMW` gives the quantile function, `rMW` generates random deviates and `hMW` gives the hazard function.

dNEE

*The New Exponentiated Exponential distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the two-parameter New Exponentiated Exponential with parameters μ and σ .

Usage

```
dNEE(x, mu = 1, sigma = 1, log = FALSE)
```

```
pNEE(q, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)
```

```
qNEE(p, mu = 1, sigma = 1, lower.tail = TRUE, log.p = FALSE)
```

```
rNEE(n = 1, mu = 1, sigma = 1)
```

```
hNEE(x, mu, sigma, log = FALSE)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of observations.

Details

The New Exponentiated Exponential distribution with parameters μ and σ has density given by

$$f(x|\mu, \sigma) = \log(2^\sigma)\mu \exp(-\mu x)(1 - \exp(-\mu x))^{\sigma-1}2^{(1-\exp(-\mu x))^\sigma},$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$.

Note: In this implementation we changed the original parameters θ for μ and α for σ , we did it to implement this distribution within gamlss framework.

Value

dNEE gives the density, pNEE gives the distribution function, qNEE gives the quantile function, rNEE generates random deviates and hNEE gives the hazard function.

dOW

The Odd Weibull Distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the Odd Weibull distribution with parameters mu, sigma and nu.

Usage

```
dOW(x, mu, sigma, nu, log = FALSE)

pOW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qOW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rOW(n, mu, sigma, nu)

hOW(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	parameter one.
sigma	parameter two.
nu	parameter three.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[T <= t], otherwise, P[T > t].
p	vector of probabilities.
n	number of observations.

Details

The Odd Weibull with parameters mu, sigma and nu has density given by

$$f(x) = \left(\frac{\sigma\nu}{x}\right) (\mu x)^\sigma e^{(\mu x)^\sigma} (e^{(\mu x)^\sigma} - 1)^{\nu-1} \left[1 + (e^{(\mu x)^\sigma} - 1)^\nu\right]^{-2}$$

for $x > 0$.

Value

dOW gives the density, pOW gives the distribution function, qOW gives the quantile function, rOW generates random deviates and hOW gives the hazard function.

dPL *The Power Lindley distribution*

Description

Density, distribution function, quantile function, random generation and hazard function for the Power Lindley distribution with parameters μ and σ .

Usage

`dPL(x, mu, sigma, log = FALSE)`

`pPL(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)`

`qPL(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)`

`rPL(n, mu, sigma)`

`hPL(x, mu, sigma)`

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Power Lindley Distribution with parameters μ and σ has density given by

$$f(x) = \frac{\mu\sigma^2}{\sigma+1}(1+x^\mu)x^{\mu-1}\exp(-\sigma x^\mu),$$

for $x > 0$.

Value

`dPL` gives the density, `pPL` gives the distribution function, `qPL` gives the quantile function, `rPL` generates random deviates and `hPL` gives the hazard function.

```

Description

Density, distribution function, quantile function, random generation and hazard function for the Quasi XGamma Poisson distribution with parameters μ , σ and ν .

Usage

```
dQXGP(x, mu, sigma, nu, log = FALSE)
pQXGP(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
qQXGP(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
rQXGP(n, mu, sigma, nu)
hQXGP(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Quasi XGamma Poisson distribution with parameters mu, sigma and nu has density given by:

$$f(x) = K(\mu, \sigma, \nu) \left(\frac{\sigma^2 x^2}{2} + \mu \right) \exp\left(\frac{\nu \exp(-\sigma x) (1 + \mu + \sigma x + \frac{\sigma^2 x^2}{2})}{1 + \mu} - \sigma x \right),$$

for $x > 0$, $\mu > 0$, $\sigma > 0$, $\nu > 1$.

where

$$K(\mu, \sigma, \nu) = \frac{\nu \sigma}{(\exp(\nu) - 1)(1 + \mu)}$$

Value

dQXGP gives the density, pQXGP gives the distribution function, qQXGP gives the quantile function, rQXGP generates random deviates and hQXGP gives the hazard function.

dRNMW

*The Reduced New Modified Weibull distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the reduced new modified Weibull distribution with parameters μ , σ and ν .

Usage

```
dRNMW(x, mu, sigma, nu, log = FALSE)
```

```
pRNMW(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
qRNMW(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
rRNMW(n, mu, sigma, nu)
```

```
hRNMW(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	parameter one.
sigma	parameter two.
nu	parameter three.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[T <= t], otherwise, P[T > t].
p	vector of probabilities.
n	number of observations.

Details

The reduced new modified Weibull with parameters mu, sigma and nu has density given by

$$f(x) = \frac{1}{2\sqrt{x}} (\mu + \sigma(1 + 2\nu x)e^{\nu x}) e^{-\mu\sqrt{x} - \sigma\sqrt{x}e^{\nu x}}$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

dRNMW gives the density, pRNMW gives the distribution function, qRNMW gives the quantile function, rRNMW generates random deviates and hRNMW gives the hazard function.

dRW *The Reflected Weibull distribution*

Description

Density, distribution function, quantile function, random generation and hazard function for the Reflected Weibull Distribution with parameters μ and σ .

Usage

```
dRW(x, mu, sigma, log = FALSE)
pRW(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)
qRW(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)
rRW(n, mu, sigma)
hRW(x, mu, sigma)
```

Arguments

<code>x, q</code>	vector of quantiles.
<code>mu</code>	parameter.
<code>sigma</code>	parameter.
<code>log, log.p</code>	logical; if TRUE, probabilities p are given as $\log(p)$.
<code>lower.tail</code>	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
<code>p</code>	vector of probabilities.
<code>n</code>	number of observations.

Details

The Reflected Weibull Distribution with parameters μ and σ has density given by

$$f(x) = \mu\sigma(-x)^{\sigma-1}e^{-\mu(-x)^\sigma},$$

for $x < 0$.

Value

`dRW` gives the density, `pRW` gives the distribution function, `qRW` gives the quantile function, `rRW` generates random deviates and `hRW` gives the hazard function.

dWALD

The Wald distribution

Description

These functions define the density, distribution function, quantile function and random generation for the Wald distribution with parameter μ and σ .

Usage

dWALD(x, mu, sigma, log = FALSE)

pWALD(q, mu, sigma, lower.tail = TRUE, log.p = FALSE)

qWALD(p, mu, sigma, lower.tail = TRUE, log.p = FALSE)

rWALD(n, mu, sigma)

Arguments

x, q	vector of (non-negative integer) quantiles.
mu	vector of the mu parameter.
sigma	vector of the sigma parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of random values to return.

Details

The Wald distribution with parameters μ and σ has density given by

$$f(x|\mu, \sigma) = \frac{\sigma}{\sqrt{2\pi x^3}} \exp\left[-\frac{(\sigma - \mu x)^2}{2x}\right],$$

for $x < 0$.

Value

dWALD gives the density, pWALD gives the distribution function, qWALD gives the quantile function, rWALD generates random deviates.

dWG

The Weibull Geometric distribution

Description

Density, distribution function, quantile function, random generation and hazard function for the weibull geometric distribution with parameters mu, sigma and nu.

Usage

```
dWG(x, mu, sigma, nu, log = FALSE)
```

```
pWG(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
qWG(p, sigma, mu, nu, lower.tail = TRUE, log.p = FALSE)
```

```
rWG(n, mu, sigma, nu)
```

```
hWG(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	scale parameter.
sigma	shape parameter.
nu	parameter of geometric random variable.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Weibull geometric distribution with parameters mu, sigma and nu has density given by

$$f(x) = (\sigma\mu^\sigma(1-\nu)x^{\sigma-1}\exp(-(\mu x)^\sigma))(1-\nu\exp(-(\mu x)^\sigma))^{-2},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $0 < \nu < 1$.

Value

dWG gives the density, pWG gives the distribution function, qWG gives the quantile function, rWG generates random deviates and hWG gives the hazard function.

dWGEE

*The Weighted Generalized Exponential-Exponential distribution***Description**

Density, distribution function, quantile function, random generation and hazard function for the Weighted Generalized Exponential-Exponential distribution with parameters μ , σ and ν .

Usage

```
dWGEE(x, mu, sigma, nu, log = FALSE)
```

```
pWGEE(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
qWGEE(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)
```

```
rWGEE(n, mu, sigma, nu)
```

```
hWGEE(x, mu, sigma, nu)
```

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are $P[X \leq x]$, otherwise, $P[X > x]$.
p	vector of probabilities.
n	number of observations.

Details

The Weighted Generalized Exponential-Exponential Distribution with parameters μ , σ and ν has density given by

$$f(x) = \sigma\nu \exp(-\nu x)(1 - \exp(-\nu x))^{\sigma-1}(1 - \exp(-\mu\nu x))/1 - \sigma B(\mu + 1, \sigma),$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

dWGEE gives the density, pWGEE gives the distribution function, qWGEE gives the quantile function, rWGEE generates random deviates and hWGEE gives the hazard function.

Description

Density, distribution function, quantile function, random generation and hazard function for the Weibull Poisson distribution with parameters μ , σ and ν .

Usage

dWP(x, mu, sigma, nu, log = FALSE)

pWP(q, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

qWP(p, mu, sigma, nu, lower.tail = TRUE, log.p = FALSE)

rWP(n, mu, sigma, nu)

hWP(x, mu, sigma, nu)

Arguments

x, q	vector of quantiles.
mu	parameter.
sigma	parameter.
nu	parameter.
log, log.p	logical; if TRUE, probabilities p are given as log(p).
lower.tail	logical; if TRUE (default), probabilities are P[X <= x], otherwise, P[X > x].
p	vector of probabilities.
n	number of observations.

Details

The Weibull Poisson distribution with parameters mu, sigma and nu has density given by

$$f(x) = \frac{\mu\sigma\nu e^{-\nu}}{1-e^{-\nu}} x^{\mu-1} \exp(-\sigma x^{\mu} + \nu \exp(-\sigma x^{\mu})),$$

for $x > 0$.

Value

dWP gives the density, pWP gives the distribution function, qWP gives the quantile function, rWP generates random deviates and hWP gives the hazard function.

 EEG

The Extended Exponential Geometric family

Description

The Extended Exponential Geometric family

Usage

```
EEG(mu.link = "log", sigma.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.

Details

The Extended Exponential Geometric distribution with parameters μ and σ has density given by

$$f(x) = \mu\sigma \exp(-\mu x)(1 - (1 - \sigma) \exp(-\mu x))^{-2},$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a EEG distribution in the `gamlss()` function.

EGG

*The four parameter Exponentiated Generalized Gamma family***Description**

The four parameter Exponentiated Generalized Gamma distribution

Usage

```
EGG(mu.link = "log", sigma.link = "log", nu.link = "log", tau.link = "log")
```

Arguments

mu.link	defines the mu.link, with "log" link as the default for the mu parameter.
sigma.link	defines the sigma.link, with "log" link as the default for the sigma.
nu.link	defines the nu.link, with "log" link as the default for the nu parameter.
tau.link	defines the tau.link, with "log" link as the default for the tau parameter.

Details

Four parameter Exponentiated Generalized Gamma distribution with parameters mu, sigma, nu and tau has density given by

$$f(x) = \frac{\nu\sigma}{\mu\Gamma(\tau)} \left(\frac{x}{\mu}\right)^{\sigma\tau-1} \exp\left\{-\left(\frac{x}{\mu}\right)^\sigma\right\} \left\{\gamma_1\left(\tau, \left(\frac{x}{\mu}\right)^\sigma\right)\right\}^{\nu-1},$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a EGG distribution in the `gamlss()` function.

EMWEx

*The Exponentiated Modified Weibull Extension family***Description**

The Exponentiated Modified Weibull Extension family

Usage

```
EMWEx(mu.link = "log", sigma.link = "log", nu.link = "log", tau.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the sigma.
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the nu parameter.
<code>tau.link</code>	defines the <code>tau.link</code> , with "log" link as the default for the tau parameter.

Details

The Beta-Weibull distribution with parameters `mu`, `sigma`, `nu` and `tau` has density given by

$$f(x) = \nu\sigma\tau\left(\frac{x}{\mu}\right)^{\sigma-1} \exp\left(\left(\frac{x}{\mu}\right)^{\sigma} + \nu\mu(1 - \exp\left(\left(\frac{x}{\mu}\right)^{\sigma}\right))\right)(1 - \exp(\nu\mu(1 - \exp\left(\left(\frac{x}{\mu}\right)^{\sigma}\right))))^{\tau-1},$$

for $x > 0$, $\nu > 0$, $\mu > 0$, $\sigma > 0$ and $\tau > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a EMWEx distribution in the `gamlss()` function.

```

Description

The Extended Odd Frechet-Nadarjad-Hanhighi family

Usage

```
EOFNH(mu.link = "log", sigma.link = "log", nu.link = "log", tau.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the <code>mu</code> parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the <code>sigma</code> .
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the <code>nu</code> parameter.
<code>tau.link</code>	defines the <code>tau.link</code> , with "log" link as the default for the <code>tau</code> parameter.

Details

The Extended Odd Fréchet-Nadarajah-Haghighi distribution with parameters `mu`, `sigma`, `nu` and `tau` has density given by

$$f(x) = \frac{\mu\sigma\nu\tau(1+\nu x)^{\sigma-1}e^{-(1+\nu x)^\sigma}[1-(1-e^{-(1+\nu x)^\sigma})^\mu]^{\tau-1}}{(1-e^{-(1+\nu x)^\sigma})^{\mu\tau+1}}e^{-[(1-e^{-(1+\nu x)^\sigma})^{-\mu}-1]^\tau},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$, $\nu > 0$ and $\tau > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a EOFNH distribution in the `gamlss()` function.

EW

*The Exponentiated Weibull family***Description**

The Exponentiated Weibull distribution

Usage

```
EW(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the <code>mu</code> parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the <code>sigma</code> .
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the <code>nu</code> parameter.

Details

The Exponentiated Weibull Distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \nu\mu\sigma x^{\sigma-1} \exp(-\mu x^\sigma)(1 - \exp(-\mu x^\sigma))^{\nu-1},$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a EW distribution in the `gamlss()` function.

EXL

The exponentiated XLindley family

Description

The function `EXL()` defines The exponentiated XLindley, a two parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
EXL(mu.link = "log", sigma.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the <code>mu</code> parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the <code>sigma</code> .

Details

The exponentiated XLindley with parameters μ and σ has density given by

$$f(x) = \frac{\sigma\mu^2(2 + \mu + x)\exp(-\mu x)}{(1 + \mu)^2} \left[1 - \left(1 + \frac{\mu x}{(1 + \mu)^2} \right) \exp(-\mu x) \right]^{\sigma-1}$$

for $x \geq 0$, $\mu \geq 0$ and $\sigma \geq 0$.

Note: In this implementation we changed the original parameters δ for μ and α for σ we did it to implement this distribution within gamlss framework.

Value

Returns a gamlss.family object which can be used to fit a EXL distribution in the gamlss() function.

ExW

The Extended Weibull family

Description

The Extended Weibull family

Usage

```
ExW(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the <code>mu</code> parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the <code>sigma</code> .
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the <code>nu</code> parameter.

Details

The Extended Weibull distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \frac{\mu\sigma\nu x^{\sigma-1} \exp(-\mu x^\sigma)}{[1-(1-\nu)\exp(-\mu x^\sigma)]^2},$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a ExW distribution in the `gamlss()` function.

ExWALD

The Ex-Wald family

Description

The function `ExWALD()` defines the Ex-wALD distribution, three-parameter continuous distribution for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
ExWALD(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the <code>mu</code> parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the <code>sigma</code> parameter.
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the <code>nu</code> parameter.

Details

The Ex-Wald distribution with parameters μ , σ and ν has density given by

$$f(x|\mu, \sigma, \nu) = \frac{1}{\nu} \exp\left(\frac{-x}{\nu} + \sigma(\mu - k)\right) F_W(x|k, \sigma) \text{ for } k \geq 0$$

$$f(x|\mu, \sigma, \nu) = \frac{1}{\nu} \exp\left(\frac{-(\sigma - \mu)^2}{2x}\right) Re\left(w(k' \sqrt{x/2} + \frac{\sigma_i}{\sqrt{2x}})\right) \text{ for } k < 0$$

where $k = \sqrt{\mu^2 - \frac{2}{\nu}}$, $k' = \sqrt{\frac{2}{\nu} - \mu^2}$ and F_W corresponds to the cumulative function of the Wald distribution.

More details about those expressions can be found on page 680 from Heathcote (2004).

Value

Returns a `gamlss.family` object which can be used to fit a Ex-WALD distribution in the `gamlss()` function.

GIW

The Generalized Inverse Weibull family

Description

The Generalized Inverse Weibull family

Usage

```
GIW(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.
`nu.link` defines the `nu.link`, with "log" link as the default for the `nu` parameter.

Details

The Generalized Inverse Weibull distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \nu \sigma \mu^\sigma x^{-(\sigma+1)} \exp\left\{-\nu \left(\frac{\mu}{x}\right)^\sigma\right\},$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a GIW distribution in the `gamlss()` function.

```

Description

The Generalized modified Weibull distribution

Usage

```
GMW(mu.link = "log", sigma.link = "log", nu.link = "sqrt", tau.link = "sqrt")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the sigma.
<code>nu.link</code>	defines the <code>nu.link</code> , with "sqrt" link as the default for the nu parameter.
<code>tau.link</code>	defines the <code>tau.link</code> , with "sqrt" link as the default for the tau parameter.

Details

The Generalized modified Weibull distribution with parameters μ , σ , ν and τ has density given by

$$f(x) = \mu\sigma x^{\nu-1}(\nu + \tau x) \exp(\tau x - \mu x^\nu e^{\tau x}) [1 - \exp(-\mu x^\nu e^{\tau x})]^{-\sigma-1},$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a GMW distribution in the `gamlss()` function.

```

initValuesOW

Initial values and search region for Odd Weibull distribution

Description

This function can be used so as to get suggestions about initial values and the search region for parameter estimation in OW distribution.

Usage

```

initValuesOW(
  formula,
  data = NULL,
  local_reg = loess.options(),
  interpolation = interp.options(),
  ...
)

```

Arguments

formula	an object of class <code>formula</code> with the response on the left of an operator \sim . The right side must be 1.
data	an optional data frame containing the response variables. If data is not specified, the variables are taken from the environment from which <code>initValuesOW</code> is called.
local_reg	a list of control parameters for LOESS. See <code>loess.options</code> .
interpolation	a list of control parameters for interpolation function. See <code>interp.options</code> .
...	further arguments passed to <code>TTTE_Analytical</code> .

Details

This function performs a non-parametric estimation of the empirical total time on test (TTT) plot. Then, this estimated curve can be used so as to get suggestions about initial values and the search region for parameters based on hazard shape associated to the shape of empirical TTT plot.

Value

Returns an object of class `c("initValOW", "HazardShape")` containing:

- `sigma.start` value for *sigma* parameter of OW distribution.
- `nu.start` value for *nu* parameter of OW distribution.
- `sigma.valid` search region for *sigma* parameter of OW distribution.
- `nu.valid` search region for *nu* parameter of OW distribution.
- `TTTplot` Total Time on Test transform computed from the data.
- `hazard_type` shape of the hazard function determined from the TTT plot.

      ylab = "Hazard function", las = 1)

```

 IW

The Inverse Weibull family

Description

The Inverse Weibull distribution

Usage

```
IW(mu.link = "log", sigma.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.

Details

The Inverse Weibull distribution with parameters `mu`, `sigma` has density given by

$$f(x) = \mu\sigma x^{-\sigma-1} \exp(\mu x^{-\sigma})$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$

Value

Returns a `gamlss.family` object which can be used to fit a IW distribution in the `gamlss()` function.

```

Description

The Kumaraswamy Inverse Weibull family

Usage

```
KumIW(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the sigma.
<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the nu parameter.

Details

The Kumaraswamy Inverse Weibull Distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \mu\sigma\nu x^{-\mu-1} \exp -\sigma x^{-\mu} (1 - \exp -\sigma x^{-\mu})^{\nu-1},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a KumIW distribution in the `gamlss()` function.

 LIN

The Lindley family

Description

The function `LIN()` defines the Lindley distribution with only one parameter for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
LIN(mu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.

Details

The Lindley with parameter μ has density given by

$$f(x) = \frac{\mu^2}{\mu+1}(1+x)\exp(-\mu x),$$

for $x > 0$ and $\mu > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a LIN distribution in the `gamlss()` function.

LW

The Log-Weibull family

Description

The Log-Weibull distribution

Usage

```
LW(mu.link = "identity", sigma.link = "log")
```

Arguments

<code>mu.link</code>	defines the <code>mu.link</code> , with "log" link as the default for the <code>mu</code> parameter.
<code>sigma.link</code>	defines the <code>sigma.link</code> , with "log" link as the default for the <code>sigma</code> .

Details

The Log-Weibull Distribution with parameters μ and σ has density given by

$$f(y) = (1/\sigma)e^{((y-\mu)/\sigma)} \exp\{-e^{((y-\mu)/\sigma)}\},$$

for $-\infty < y < \infty$.

Value

Returns a `gamlss.family` object which can be used to fit a LW distribution in the `gamlss()` function.

MOK

*The Marshall-Olkin Kappa family***Description**

The Marshall-Olkin Kappa family

Usage

```
MOK(mu.link = "log", sigma.link = "log", nu.link = "log", tau.link = "log")
```

Arguments

mu.link	defines the mu.link, with "log" link as the default for the mu parameter.
sigma.link	defines the sigma.link, with "log" link as the default for the sigma.
nu.link	defines the nu.link, with "log" link as the default for the nu parameter.
tau.link	defines the tau.link, with "log" link as the default for the tau parameter.

Details

The Marshall-Olkin Kappa distribution with parameters mu, sigma, nu and tau has density given by

$$f(x) = \frac{\tau \frac{\mu\nu}{\sigma} \left(\frac{x}{\sigma}\right)^{\nu-1} \left(\mu + \left(\frac{x}{\sigma}\right)^{\mu\nu}\right)^{-\frac{\mu+1}{\mu}}}{\left(\tau + (1-\tau) \left(\frac{\left(\frac{x}{\sigma}\right)^{\mu\nu}}{\mu + \left(\frac{x}{\sigma}\right)^{\mu\nu}}\right)^{\frac{1}{\mu}}\right)^2}$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a MOK distribution in the `gamlss()` function.

<code>nu.link</code>	defines the <code>nu.link</code> , with "log" link as the default for the <code>nu</code> parameter.

Details

The Modified Weibull distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \mu(\sigma + \nu x)x^{\sigma-1} \exp(\nu x) \exp(-\mu x^\sigma \exp(\nu x)),$$

for $x > 0$, $\mu > 0$, $\sigma \geq 0$ and $\nu \geq 0$.

Value

Returns a `gamlss.family` object which can be used to fit a MW distribution in the `gamlss()` function.

myOW_region

Customized region search for odd Weibull distribution

Description

This function can be used to modify OW `gamlss.family` object in order to set a customized region search for `gamlss()` function.

Usage

```
myOW_region(family = OW, valid.values = "auto", initVal)
```

Arguments

family	The OW family. This arguments allows the user to modify input arguments of the family, like the link functions.
valid.values	a list of character elements specifying the region for sigma and/or nu. See Details and Examples section to learn about its use.
initVal	An <code>initValOW</code> object generated with <code>initValuesOW</code> function.

Details

This function was created to help users to fit OW distribution easily bounding the parametric space for sigma and nu.

The `valid.values` must be defined as a list of characters containing a call of the `all` function.

Value

Returns a `gamlss.family` object which can be used to fit an OW distribution in the `gamlss()` function.

exp(coef(mod1, what='sigma'))
exp(coef(mod1, what='nu'))

# Example 2
# Same example using another link function and using 'myOW_region'
# in the argument 'family'
mod2 <- gamlss(y~1, sigma.fo=~1, nu.fo=~1,
              sigma.start=2, nu.start=0.1,
              control=gamlss.control(n.cyc=300, trace=FALSE),
              family=myOW_region(family=OW(sigma.link='identity'),
                                valid.values=myvalues,
                                initVal=my_initial_guess))

exp(coef(mod2, what='mu'))
coef(mod2, what='sigma')
exp(coef(mod2, what='nu'))
```

Description

The function `NEE()` defines the New Exponentiated Exponential distribution, a two parameter distribution, for a `gamlss.family` object to be used in `GAMLSS` fitting using the function `gamlss()`.

Usage

```
NEE(mu.link = "log", sigma.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "logit" link as the default for the `sigma`.

Details

The New Exponentiated Exponential distribution with parameters `mu` and `sigma` has density given by

$$f(x|\mu, \sigma) = \log(2^\sigma) \mu \exp(-\mu x) (1 - \exp(-\mu x))^{\sigma-1} 2^{(1-\exp(-\mu x))^\sigma},$$

for $x > 0$, $\mu > 0$ and $\sigma > 0$.

Note: In this implementation we changed the original parameters θ for μ and α for σ , we did it to implement this distribution within `gamlss` framework.

Value

Returns a `gamlss.family` object which can be used to fit a NEE distribution in the `gamlss()` function.

OW

*The Odd Weibull family***Description**

The function `OW()` defines the Odd Weibull distribution, a three parameter distribution, for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
OW(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.
`nu.link` defines the `nu.link`, with "log" link as the default for the `nu`.

Details

The odd Weibull with parameters `mu`, `sigma` and `nu` has density given by

$$f(t) = \left(\frac{\sigma\nu}{t}\right) (\mu t)^\sigma e^{(\mu t)^\sigma} (e^{(\mu t)^\sigma} - 1)^{\nu-1} \left[1 + (e^{(\mu t)^\sigma} - 1)^\nu\right]^{-2}$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a OW distribution in the `gamlss()` function.

coef(mod, what="sigma")
coef(mod, what="nu")

```

param.startOW

Initial values extraction for Odd Weibull distribution

Description

This function can be used to extract initial values found with empirical time on test transform (TTT) through [initValuesOW](#) function. This is used for parameter estimation in OW distribution.

Usage

```
param.startOW(param, initValOW)
```

Arguments

param	a character used to specify the parameter required. It can take the values "sigma" or "nu".
initValOW	an initValOW object generated with <code>initValuesOW</code> function.

Details

This function just gets initial values computed with `initValuesOW` for OW family. It must be called in `sigma.start` and `nu.start` arguments from `gamlss` function. This function is useful only if user want to set start values automatically with TTT plot. See example for an illustration.

Value

A length-one vector numeric value corresponding to the initial value of the parameter specified in `param` extracted from a `initValuesOW` object specified in the `initValOW` input argument.

Author(s)

Jaime Mosquera Gutiérrez <jmosquerag@unal.edu.co>

Examples

```
# Random data generation (OW distributed)
y <- rOW(n=500, mu=0.05, sigma=0.6, nu=2)

# Initial values with TTT plot
iv <- initValuesOW(formula = y ~ 1)
summary(iv)

# This data is from unimodal hazard
# See TTT estimate from sample
plot(iv, legend_options=list(pos=1.03))

# See the true hazard
curve(hOW(x, mu=0.05, sigma=0.6, nu=2), to=100, lwd=3, ylab="h(x)")

# Finally, we fit the model
require(gamlss)
con.out <- gamlss.control(n.cyc = 300, trace = FALSE)
con.in <- glim.control(cyc = 300)

(sigma.start <- param.startOW("sigma", iv))
(nu.start <- param.startOW("nu", iv))

mod <- gamlss(y~1, sigma.fo=~1, nu.fo=~1, control=con.out, i.control=con.in,
             family=myOW_region(OW(sigma.link="identity", nu.link="identity"),
                                valid.values="auto", iv),
             sigma.start=sigma.start, nu.start=nu.start)

# Estimates are close to actual values
(mu <- exp(coef(mod, what = "mu")))
```

```
(sigma <- coef(mod, what = "sigma"))
(nu <- coef(mod, what = "nu"))
```

 PL

The Power Lindley family

Description

Power Lindley distribution

Usage

```
PL(mu.link = "log", sigma.link = "log")
```

Arguments

<code>mu.link</code>	defines the mu.link, with "log" link as the default for the mu parameter.
<code>sigma.link</code>	defines the sigma.link, with "log" link as the default for the sigma.

Details

The Power Lindley Distribution with parameters mu and sigma has density given by

$$f(x) = \frac{\mu\sigma^2}{\sigma+1}(1+x^\mu)x^{\mu-1}\exp(-\sigma x^\mu),$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a PL distribution in the `gamlss()` function.

QXGP

The Quasi XGamma Poisson family

Description

The Quasi XGamma Poisson family

Usage

```
QXGP(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

mu.link	defines the mu.link, with "log" link as the default for the mu parameter.
sigma.link	defines the sigma.link, with "log" link as the default for the sigma.
nu.link	defines the nu.link, with "log" link as the default for the nu parameter.

Details

The Quasi XGamma Poisson distribution with parameters μ , σ and ν has density given by

$$f(x) = K(\mu, \sigma, \nu) \left(\frac{\sigma^2 x^2}{2} + \mu \right) \exp\left(\frac{\nu \exp(-\sigma x) (1 + \mu + \sigma x + \frac{\sigma^2 x^2}{2})}{1 + \mu} - \sigma x \right),$$

for $x > 0$, $\mu > 0$, $\sigma > 0$, $\nu > 1$.

where

$$K(\mu, \sigma, \nu) = \frac{\nu \sigma}{(\exp(\nu) - 1)(1 + \mu)}$$

Value

Returns a `gamlss.family` object which can be used to fit a QXGP distribution in the `gamlss()` function.

```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.

Details

The Reflected Weibull Distribution with parameters `mu` and `sigma` has density given by

$$f(y) = \mu\sigma(-y)^{\sigma-1}e^{-\mu(-y)^\sigma},$$

for $y < 0$

Value

Returns a `gamlss.family` object which can be used to fit a RW distribution in the `gamlss()` function.

summary.initValOW

Summary of initValOW objects

Description

This summary method displays initial values and search regions for [OW](#) family.

Usage

```

## S3 method for class 'initValOW'
summary(object, ...)

```

Arguments

object an object of class `initVal`, generated with `initValuesOW`.
 ... extra arguments

Value

No return value, it just prints out in the console the initial values and the search regions for *sigma* and *nu* from OW distribution (see `dOW`).

Author(s)

Jaime Mosquera Gutiérrez <jmosquerag@unal.edu.co>

 SZMW

The Sarhan and Zaindin's Modified Weibull family

Description

The Sarhan and Zaindin's Modified Weibull distribution

Usage

```
SZMW(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.
`nu.link` defines the `nu.link`, with "log" link as the default for the `nu` parameter.

Details

The Sarhan and Zaindin's Modified Weibull distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = (\mu + \sigma \nu x^{\nu-1}) \exp(-\mu x - \sigma x^\nu),$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a SZMW distribution in the `gamlss()` function.

WALD

The Wald family

Description

The function `WALD()` defines the `wALD` distribution, two-parameter continuous distribution for a `gamlss.family` object to be used in GAMLSS fitting using the function `gamlss()`.

Usage

```
WALD(mu.link = "log", sigma.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma` parameter.

Details

The Wald distribution with parameters μ and σ has density given by

$$f(x|\mu, \sigma) = \frac{\sigma}{\sqrt{2\pi x^3}} \exp\left[-\frac{(\sigma - \mu x)^2}{2x}\right], x > 0$$

Value

Returns a `gamlss.family` object which can be used to fit a WALD distribution in the `gamlss()` function.

summary(mod2)

```

Description

The Weibull Geometric distribution

Usage

```
WG(mu.link = "log", sigma.link = "log", nu.link = "logit")
```

Arguments

mu.link defines the mu.link, with "log" link as the default for the mu parameter.
 sigma.link defines the sigma.link, with "log" link as the default for the sigma.
 nu.link defines the nu.link, with "log" link as the default for the nu parameter.

Details

The weibull geometric distribution with parameters mu, sigma and nu has density given by

$$f(x) = (\sigma\mu^\sigma(1-\nu)x^{\sigma-1}\exp(-(\mu x)^\sigma))(1-\nu\exp(-(\mu x)^\sigma))^{-2},$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $0 < \nu < 1$.

Value

Returns a gamlss.family object which can be used to fit a WG distribution in the gamlss() function.

WGEE

The Weighted Generalized Exponential-Exponential family

Description

The Weighted Generalized Exponential-Exponential family

Usage

```
WGEE(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.
`nu.link` defines the `nu.link`, with "log" link as the default for the `nu` parameter.

Details

The Weighted Generalized Exponential-Exponential distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \sigma\nu \exp(-\nu x)(1 - \exp(-\nu x))^{\sigma-1}(1 - \exp(-\mu\nu x))/1 - \sigma B(\mu + 1, \sigma),$$

for $x > 0$, $\mu > 0$, $\sigma > 0$ and $\nu > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a WGEE distribution in the `gamlss()` function.

Author(s)

Johan David Marin Benjumea, <johand.marin@udea.edu.co>

References

coef(mod, what="mu")
coef(mod, what="sigma")
exp(coef(mod, what="nu"))
```

Description

The Weibull Poisson family

Usage

```
WP(mu.link = "log", sigma.link = "log", nu.link = "log")
```

Arguments

`mu.link` defines the `mu.link`, with "log" link as the default for the `mu` parameter.
`sigma.link` defines the `sigma.link`, with "log" link as the default for the `sigma`.
`nu.link` defines the `nu.link`, with "log" link as the default for the `nu` parameter.

Details

The Weibull Poisson distribution with parameters `mu`, `sigma` and `nu` has density given by

$$f(x) = \frac{\mu\sigma\nu e^{-\nu}}{1-e^{-\nu}} x^{\mu-1} \exp(-\sigma x^{\mu} + \nu \exp(-\sigma x^{\mu})),$$

for $x > 0$.

Value

Returns a `gamlss.family` object which can be used to fit a WP distribution in the `gamlss()` function.
