Package 'ggiraph'

February 21, 2026

Type Package

Title Make 'ggplot2' Graphics Interactive

Version 0.9.6

Description Create interactive 'ggplot2' graphics using 'htmlwidgets'.

License GPL-3

URL https://davidgohel.github.io/ggiraph/

BugReports https://github.com/davidgohel/ggiraph/issues

Imports cli, dplyr, gdtools (>= 0.5.0), ggplot2 (>= 4.0.0), grid,
htmltools, htmlwidgets (>= 1.5), MASS, purrr, Rcpp (>= 1.1.0),
rlang, S7 (>= 0.2.0), stats, systemfonts (>= 1.3.1), vctrs

Suggests ggbeeswarm, ggrepel (>= 0.9.1), hexbin, knitr, maps,
quantreg, rmarkdown, sf (>= 1.0), shiny, tinytest, xml2 (>=
1.0)

LinkingTo Rcpp, systemfonts

VignetteBuilder knitr

annotate_interactive   *Create interactive annotations*

Description

The layer is based on [ggplot2::annotate()](). See the documentation for that function for more details.

Usage

```
annotate_interactive(...)
```

Arguments

...   arguments passed to base function, plus any of the interactive_parameters.

Details for annotate_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

See Also

girafe(), interactive_parameters, annotation_raster_interactive()

Examples

```
# add interactive annotation to a ggplot -------
library(ggplot2)
library(ggiraph)
library(gdtools)

register_liberationsans()

gg <- ggplot(mtcars, aes(x = disp, y = qsec)) +
  geom_point(size = 2) +
  annotate_interactive(
    "rect",
    xmin = 100,
    xmax = 400,
    fill = "red",
    data_id = "an_id",
    tooltip = "a tooltip",
    ymin = 18,
    ymax = 20,
    alpha = .5
  ) +
  theme_minimal(base_family = "Liberation Sans", base_size = 11)

girafe(
  ggobj = gg,
  width_svg = 5,
  height_svg = 4,
  dependencies = list(
    liberationsansHtmlDependency()
  )
)
```

---

annotation_raster_interactive

Create interactive raster annotations

Description

The layer is based on `ggplot2::annotation_raster()`. See the documentation for that function
for more details.

Usage

```
annotation_raster_interactive(...)
```

Arguments

`...`   arguments passed to base function, plus any of the interactive_parameters.

Details for annotate_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they can be
scalar values or vectors depending on params on base function.

See Also

`girafe()`

Examples

```
# add interactive raster annotation to a ggplot -------
library(ggplot2)
library(ggiraph)

# Generate data
rainbow <- matrix(hcl(seq(0, 360, length.out = 50 * 50), 80, 70), nrow = 50)
p <- ggplot(mtcars, aes(mpg, wt)) +
  geom_point() +
  annotation_raster_interactive(
    rainbow,
    15,
    20,
    3,
    4,
    tooltip = "I am an image!"
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# To fill up whole plot
p <- ggplot(mtcars, aes(mpg, wt)) +
  annotation_raster_interactive(
    rainbow,
    -Inf,
    Inf,
    -Inf,
```

```
     Inf,
     tooltip = "I am an image too!"
   ) +
   geom_point()
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}
```

---

dsvg   *SVG Graphics Driver*

Description

This function produces SVG files (compliant to the current w3 svg XML standard) where elements can be made interactive.

In order to generate the output, used fonts must be available on the computer used to create the svg, used fonts must also be available on the computer used to render the svg.

Usage

```
dsvg(
  file = "Rplots.svg",
  width = 6,
  height = 6,
  bg = "white",
  pointsize = 12,
  standalone = TRUE,
  setdims = TRUE,
  canvas_id = "svg_1",
  title = NULL,
  desc = NULL,
  fonts = list()
)
```

Arguments

file	the file where output will appear.
height, width	Height and width in inches.
bg	Default background color for the plot (defaults to "white").
pointsize	default point size.
standalone	Produce a stand alone svg file? If FALSE, omits xml header and default namespace.
setdims	If TRUE (the default), the svg node will have attributes width & height set.
canvas_id	svg id within HTML page.

title	A label for accessibility purposes (aria-label/aria-labelledby). Be aware that when using this, the browser will use it as a tooltip for the whole svg and it may class with the interactive elements' tooltip.
desc	A longer description for accessibility purposes (aria-description/aria-describedby).
fonts	Named list of font names to be aliased with fonts installed on your system. If unspecified, the defaults from gdtools::font_set_liberation() are used for the R families "sans", "serif", "mono" and "symbol".
	As an example, using fonts = list(sans = "Roboto") would make the default font "Roboto" as many ggplot themes use theme_minimal(base_family = "sans").

See Also

[Devices](#)

Examples

```
fileout <- tempfile(fileext = ".svg")
dsvg(file = fileout)
plot(rnorm(10), main="Simple Example", xlab = "", ylab = "")
dev.off()
```

---

dsvg_view   *Run plotting code and view svg in RStudio Viewer or web broswer.*

Description

This is useful primarily for testing. Requires the htmltools package.

Usage

```
dsvg_view(code, ...)
```

Arguments

code	Plotting code to execute.
...	Other arguments passed on to [dsvg()](#).

Examples

```
dsvg_view(plot(1:10))
dsvg_view(hist(rnorm(100)))
```

---

element_interactive   *Create interactive theme elements*

Description

With these functions the user can add interactivity to various ggplot2::theme() elements.

They are based on ggplot2::element_rect(), ggplot2::element_line() and ggplot2::element_text() See the documentation for those functions for more details.

Usage

```
element_line_interactive(...)

element_rect_interactive(...)

element_text_interactive(...)
```

Arguments

...   arguments passed to base function, plus any of the interactive_parameters.

Details for element_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they should be scalar values.

For theme text elements (element_text_interactive()), the interactive parameters can also be supplied while setting a label value, via the ggplot2::labs() family of functions or when setting a scale/guide title or key label. Instead of setting a character value for the element, function label_interactive() can be used to define interactive parameters to go along with the label. When the parameters are supplied that way, they override the default values that are set at the theme via element_text_interactive() or via the guide's theme parameters.

}
```

---

facet_grid_interactive

Create interactive grid facets

Description

These facets are based on ggplot2::facet_grid().

To make a facet interactive, it is mandatory to use labeller_interactive() for argument labeller.

Usage

```
facet_grid_interactive(..., interactive_on = "text")
```

Arguments

...	arguments passed to base function and labeller_interactive() for argument labeller.
interactive_on	one of 'text' (only strip text are made interactive), 'rect' (only strip rectangles are made interactive) or 'both' (strip text and rectangles are made interactive).

Value

An interactive facetting object.

See Also

girafe()

---

facet_wrap_interactive

Create interactive wraped facets

Description

These facets are based on ggplot2::facet_wrap().

To make a facet interactive, it is mandatory to use labeller_interactive() for argument `labeller`.

Usage

```
facet_wrap_interactive(..., interactive_on = "text")
```

Arguments

`...`	arguments passed to base function and labeller_interactive() for argument `labeller`.
`interactive_on`	one of 'text' (only strip text are made interactive), 'rect' (only strip rectangles are made interactive) or 'both' (strip text and rectangles are made interactive).

Value

An interactive facetting object.

See Also

girafe()

---

geom_abline_interactive

Create interactive reference lines

Description

These geometries are based on ggplot2::geom_abline(), ggplot2::geom_hline() and ggplot2::geom_vline().

Usage

```
geom_abline_interactive(...)

geom_hline_interactive(...)

geom_vline_interactive(...)
```

Arguments

...   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

geom_bar_interactive   *Create interactive bars*

Description

The geometries are based on `ggplot2::geom_bar()` and `ggplot2::geom_col()`. See the documentation for those functions for more details.

Usage

```
geom_bar_interactive(...)

geom_col_interactive(...)
```

Arguments

    `...`   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

geom_bin_2d_interactive

Create interactive heatmaps of 2d bin counts

Description

The geometry is based on [ggplot2::geom_bin_2d()](). See the documentation for those functions for more details.

Usage

```
geom_bin_2d_interactive(...)
```

Arguments

  ...   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

See Also

`girafe()`

Examples

```
# add interactive bin2d heatmap to a ggplot -------
library(ggplot2)
library(ggiraph)

p <- ggplot(diamonds, aes(x, y, fill = cut)) +
  xlim(4, 10) +
  ylim(4, 10) +
  geom_bin2d_interactive(aes(tooltip = cut), bins = 30)

x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}
```

---

  geom_boxplot_interactive

                                Create interactive boxplot

Description

The geometry is based on `ggplot2::geom_boxplot()`. See the documentation for that function for more details.

Usage

```
geom_boxplot_interactive(...)
```

Arguments

  ...   arguments passed to base function, plus any of the interactive_parameters.

Details

You can supply `interactive parameters` for the outlier points by prefixing them with `outlier.` prefix. For example: aes(outlier.tooltip = 'bla', outlier.data_id = 'blabla').

IMPORTANT: when supplying outlier interactive parameters, the correct `group` aesthetic *must* be also supplied. Otherwise the default group calculation will be incorrect, which will result in an incorrect plot.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

```

geom_contour_interactive

Create interactive 2d contours of a 3d surface

Description

These geometries are based on [ggplot2::geom_contour()](#) and [ggplot2::geom_contour_filled()](#).
See the documentation for those functions for more details.

Usage

```
geom_contour_interactive(...)

geom_contour_filled_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the [interactive_parameters](#).

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [ggplot2::aes()](#)). In this way they can be
  mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a
  scalar value.

See Also

[girafe()](#)

Examples

```
# add interactive contours to a ggplot -------
library(ggplot2)
library(ggiraph)

v <- ggplot(faithfuld, aes(waiting, eruptions, z = density))
p <- v +
  geom_contour_interactive(aes(
    colour = after_stat(level),
    tooltip = paste("Level:", after_stat(level))
  ))
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}
```

```
if (packageVersion("grid") >= numeric_version("3.6")) {
  p <- v +
    geom_contour_filled_interactive(aes(
      colour = after_stat(level),
      fill = after_stat(level),
      tooltip = paste("Level:", after_stat(level))
    ))
  x <- girafe(ggobj = p)
  if (interactive()) print(x)
}
```

---

geom_count_interactive

Create interactive point counts

Description

The geometry is based on `ggplot2::geom_bin2d()`. See the documentation for those functions for more details.

Usage

```
geom_count_interactive(...)
```

Arguments

`...`   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

```

```
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

p2 <- ggplot(diamonds, aes(x = cut, y = clarity)) +
  geom_count_interactive(aes(
    size = after_stat(prop),
    tooltip = after_stat(round(prop, 3)),
    group = 1
  )) +
  scale_size_area(max_size = 10)
x <- girafe(ggobj = p2)
if (interactive()) {
  print(x)
}
```

---

geom_crossbar_interactive

Create interactive vertical intervals: lines, crossbars & errorbars

---

Description

These geometries are based on `ggplot2::geom_crossbar()`, `ggplot2::geom_errorbar()`, `ggplot2::geom_linerange()` and `ggplot2::geom_pointrange()`. See the documentation for those functions for more details.

Usage

```
geom_crossbar_interactive(...)

geom_errorbar_interactive(...)

geom_linerange_interactive(...)

geom_pointrange_interactive(...)
```

Arguments

`...`	arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

geom_density_interactive

Create interactive smoothed density estimates

Description

The geometry is based on [ggplot2::geom_density()](). See the documentation for those functions for more details.

Usage

```
geom_density_interactive(...)
```

Arguments

... arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}
```

geom_dotplot_interactive

Create interactive dot plots

Description

This geometry is based on `ggplot2::geom_dotplot()`. See the documentation for those functions for more details.

Usage

```
geom_dotplot_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

    stackdir = "center",
    position = "dodge"
  )

x <- girafe(ggobj = gg_point)
if (interactive()) {
  print(x)
}
```

geom_errorbarh_interactive

Create interactive horizontal error bars

Description

This geometry is based on [ggplot2::geom_errorbarh()](). See the documentation for those functions for more details.

Usage

```
geom_errorbarh_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

See Also

`girafe()`

Examples

```
# add horizontal error bars -------
library(ggplot2)
library(ggiraph)

df <- data.frame(
  trt = factor(c(1, 1, 2, 2)),
  resp = c(1, 5, 3, 4),
  group = factor(c(1, 2, 1, 2)),
  se = c(0.1, 0.3, 0.3, 0.2)
)

# Define the top and bottom of the errorbars

p <- ggplot(df, aes(resp, trt, colour = group))
g <- p +
  geom_point() +
  geom_errorbarh_interactive(aes(
    xmax = resp + se,
    xmin = resp - se,
    tooltip = group
  ))
x <- girafe(ggobj = g)
if (interactive()) {
  print(x)
}
```

---

geom_freqpoly_interactive

Create interactive histograms and frequency polygons

Description

The geometries are based on `ggplot2::geom_histogram()` and `ggplot2::geom_freqpoly()`. See the documentation for those functions for more details.

This interactive version is only providing a single tooltip per group of data (same for `data_id`). It means it is only possible to associate a single tooltip to a set of bins.

Usage

```
geom_freqpoly_interactive(...)

geom_histogram_interactive(...)
```

Arguments

    `...`   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

    bins = 30,
    aes(tooltip = after_stat(count), group = 1L)
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

p <- ggplot(diamonds, aes(price, colour = cut, tooltip = cut, data_id = cut)) +
  geom_freqpoly_interactive(binwidth = 500)
x <- girafe(ggobj = p)
x <- girafe_options(x = x, opts_hover(css = "stroke-width:3px;"))
if (interactive()) {
  print(x)
}
```

---

geom_hex_interactive   *Create interactive hexagonal heatmaps*

Description

The geometry is based on `ggplot2::geom_hex()`. See the documentation for those functions for more details.

Usage

```
geom_hex_interactive(...)
```

Arguments

`...`   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

Examples

```
# add interactive hexagonal heatmaps to a ggplot -------
library(ggplot2)
library(ggiraph)

p <- ggplot(diamonds, aes(carat, price)) +
  geom_hex_interactive(aes(tooltip = after_stat(count)), bins = 10)
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}
```

---

geom_jitter_interactive
Create interactive jittered points

Description

The geometry is based on `ggplot2::geom_jitter()`. See the documentation for those functions for more details.

Usage

```
geom_jitter_interactive(...)
```

Arguments

`...`	arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

) +
  geom_jitter_interactive()

x <- girafe(ggobj = gg_jitter)
if (interactive()) {
  print(x)
}
```

---

geom_label_interactive

Create interactive textual annotations

Description

The geometries are based on ggplot2::geom_text() and ggplot2::geom_label(). See the documentation for those functions for more details.

Usage

```
geom_label_interactive(...)

geom_text_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via ggplot2::aes()). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

geom_point_interactive

Create interactive points

Description

The geometry is based on [ggplot2::geom_point()](). See the documentation for those functions for more details.

Usage

```
geom_point_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the [interactive_parameters]().

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [ggplot2::aes()]()). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

Note

The following shapes id 3, 4 and 7 to 14 are composite symbols and should not be used.

geom_quantile_interactive

Create interactive quantile regression

Description

The geometry is based on [ggplot2::geom_quantile()](). See the documentation for those functions for more details.

Usage

```
geom_quantile_interactive(...)
```

Arguments

...   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

```

geom_raster_interactive

Create interactive raster rectangles

Description

The geometry is based on `ggplot2::geom_raster()`. See the documentation for those functions for more details.

Usage

```
geom_raster_interactive(...)
```

Arguments

`...`   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

See Also

`girafe()`

`girafe()`

Examples

```
# add interactive raster to a ggplot -------
library(ggplot2)
library(ggiraph)

df <- expand.grid(x = 0:5, y = 0:5)
df$z <- runif(nrow(df))

gg <- ggplot(df, aes(x, y, fill = z, tooltip = "tooltip")) +
  geom_raster_interactive() +
  scale_fill_gradient_interactive(
    data_id = "coco",
    onclick = "cici",
    tooltip = "cucu"
  )

x <- girafe(ggobj = gg)
if (interactive()) {
```

```
  print(x)
}
```

---

geom_rect_interactive   *Create interactive rectangles*

Description

These geometries are based on [ggplot2::geom_rect()](#) and [ggplot2::geom_tile()](#). See the
documentation for those functions for more details.

Usage

```
geom_rect_interactive(...)

geom_tile_interactive(...)
```

Arguments

```
...                    arguments passed to base function, plus any of the interactive_parameters.
```

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [ggplot2::aes()](#)). In this way they can be
  mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a
  scalar value.

Note

Converting a raster to svg elements could inflate dramatically the size of the svg and make it unread-
able in a browser. Function geom_tile_interactive should be used with caution, total number of
rectangles should be small.

}
```

---

geom_smooth_interactive

Create interactive smoothed conditional means

Description

The geometry is based on `ggplot2::geom_smooth()`. See the documentation for those functions for more details.

Usage

```
geom_smooth_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

See Also

`girafe()`

Examples

```
# add interactive bar -------
library(ggplot2)
library(ggiraph)

p <- ggplot(mpg, aes(displ, hwy)) +
  geom_point() +
  geom_smooth_interactive(aes(tooltip = "smoothed line", data_id = "smooth"))
x <- girafe(ggobj = p)
x <- girafe_options(x = x, opts_hover(css = "stroke:orange;stroke-width:3px;"))
if (interactive()) {
  print(x)
}

p <- ggplot(mpg, aes(displ, hwy)) +
  geom_point() +
```

```
  geom_smooth_interactive(
    method = lm,
    se = FALSE,
    tooltip = "smooth",
    data_id = "smooth"
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

p <- ggplot(
  mpg,
  aes(displ, hwy, colour = class, tooltip = class, data_id = class)
) +
  geom_point_interactive() +
  geom_smooth_interactive(se = FALSE, method = lm)
x <- girafe(ggobj = p)
x <- girafe_options(x = x, opts_hover(css = "stroke:red;stroke-width:3px;"))
if (interactive()) {
  print(x)
}
```

---

geom_spoke_interactive

Create interactive line segments parameterised by location, direction and distance

---

Description

The geometry is based on [ggplot2::geom_spoke()](). See the documentation for those functions for more details.

Usage

```
geom_spoke_interactive(...)
```

Arguments

...	arguments passed to base function, plus any of the [interactive_parameters]().

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via [ggplot2::aes()]()). In this way they can be mapped to data columns and apply to a set of geometries.
- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

if (interactive()) {
  print(x2)
}
```

---

geom_text_repel_interactive

Create interactive repulsive textual annotations

Description

The geometries are based on ggrepel::geom_text_repel() and ggrepel::geom_label_repel().
See the documentation for those functions for more details.

Usage

```
geom_text_repel_interactive(...)

geom_label_repel_interactive(...)
```

Arguments

...   arguments passed to base function, plus any of the interactive_parameters.

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

Note

The ggrepel package is required for these geometries

      css = ggiraph::girafe_css(
        css = ";",
        area = "fill:#FF4C3B;"
      )
    )
  )
  if (interactive()) print(x2)
}
```

geom_violin_interactive

Create interactive violin plot

Description

The geometry is based on [ggplot2::geom_violin()](). See the documentation for those functions
for more details.

Usage

```
geom_violin_interactive(...)
```

Arguments

...   arguments passed to base function, plus any of the [interactive_parameters]().

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

`girafe()`

Examples

```
# add interactive violin plot -------
library(ggplot2)
library(ggiraph)

p <- ggplot(mtcars, aes(factor(cyl), mpg)) +
  geom_violin_interactive(aes(fill = cyl, tooltip = cyl))
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# Show quartiles
p2 <- ggplot(mtcars, aes(factor(cyl), mpg)) +
  geom_violin_interactive(
    aes(tooltip = after_stat(density)),
    draw_quantiles = c(0.25, 0.5, 0.75)
  )
x2 <- girafe(ggobj = p2)
if (interactive()) {
  print(x2)
}
```

---

girafe *Create a girafe object*

Description

Create an interactive graphic with a ggplot object to be used in a web browser.

Usage

```
girafe(
  ggobj = NULL,
  code,
  pointsize = 12,
```

```
    width_svg = NULL,
    height_svg = NULL,
    options = list(),
    font_set = NULL,
    dependencies = NULL,
    check_fonts_registered = FALSE,
    check_fonts_dependencies = FALSE,
    ...
)
```

Arguments

ggobj	ggplot object to print. Argument code will be ignored if this argument is supplied.
code	Plotting code to execute
pointsize	the default pointsize of plotted text in pixels, default to 12.
width_svg, height_svg	
	The width and height of the graphics region in inches. The default values are 6 and 5 inches. This will define the aspect ratio of the graphic as it will be used to define viewbox attribute of the SVG result.
	If you use girafe() in an 'R Markdown' document, we recommend not using these arguments so that the knitr options fig.width and fig.height are used instead.
options	a list of options for girafe rendering, see opts_tooltip(), opts_hover(), opts_selection(), …
font_set	A gdtools::font_set() object controlling font aliases and HTML dependencies. The default is gdtools::font_set_liberation(), which uses Liberation fonts (bundled by 'fontquiver' under the SIL Open Font License). This makes output reproducible offline without requiring any system font.
	For system-aware font selection use gdtools::font_set_auto(), or build a custom configuration with gdtools::font_set().
	font_set$dsvg_fonts is passed as fonts argument to dsvg() and font_set$dependencies are appended to dependencies.
dependencies	Additional widget HTML dependencies, see htmlwidgets::createWidget().
check_fonts_registered	
	whether to check if fonts families found in the ggplot are registered with 'systemfonts'.
check_fonts_dependencies	
	whether to check if fonts families found in the ggplot are found in the dependencies list.
...	arguments passed on to dsvg()

Details

Use geom_zzz_interactive to create interactive graphical elements.

Tooltips can be displayed when mouse is over graphical elements.

If id are associated with points, they get animated when mouse is over and can be selected when used in shiny apps.

On click actions can be set with javascript instructions. This option should not be used simultaneously with selections in Shiny applications as both features are "on click" features.

When a zoom effect is set, "zoom activate", "zoom desactivate" and "zoom init" buttons are available in a toolbar.

When selection type is set to 'multiple' (in Shiny applications), lasso selection and lasso anti-selections buttons are available in a toolbar.

Managing Grouping with Interactive Aesthetics

Adding an interactive aesthetic like tooltip can sometimes alter the implicit grouping that ggplot2 performs automatically.

In these cases, you **must explicitly** specify the group aesthetic to ensure correct graph rendering by clearly defining the variables that determine the grouping.

```
mapping = ggplot2::aes(tooltip = .data_tooltip, group = interaction(factor1, factor2, ...))
```

This precaution is necessary:

- ggplot2 automatically determines grouping based on the provided aesthetics
- Interactive aesthetics added by ggiraph can interfere with this logic
- Explicit group specification prevents unexpected behavior and ensures predictable results

Widget options

girafe animations can be customized with function `girafe_options()`. Options are available to customize tooltips, hover effects, zoom effects selection effects and toolbar.

Options passed to girafe() are merged with defaults set via `set_girafe_defaults()`. This means you can define global styles once and override only specific parameters per plot. For example, if you set a custom tooltip CSS globally, you can still adjust offx and offy in a specific girafe() call without losing your CSS styling.

Widget sizing

girafe graphics are responsive, which mean, they will be resized according to their container. There are two responsive behavior implementations:

- one for Shiny applications and flexdashboard documents,
- and another one for other documents (i.e. R markdown and saveWidget).

Graphics are created by an R graphic device (i.e pdf, png, svg here) and need arguments width and height to define a graphic region. Arguments width_svg and height_svg are used as corresponding values. They are defining the aspect ratio of the graphic. This proportion is always respected when the graph is displayed.

When a girafe graphic is in a Shiny application, graphic will be resized according to the arguments width and height of the function girafeOutput. Default values are '100\ outer bounding box of the graphic (the HTML element that will contain the graphic with an aspect ratio).

When a girafe graphic is in an R markdown document (producing an HTML document), the graphic
will be resized according to the argument `width` of the function `girafe`. Its value is beeing used
to define a relative width of the graphic within its HTML container. Its height is automatically
adjusted regarding to the argument `width` and the aspect ratio.

[girafe_options()](), [dsvg()](), [gdtools::font_set()]()

Examples

```
library(ggplot2)
library(ggiraph)
library(gdtools)

fonts <- font_set(sans = font_liberation("sans"))

dataset <- mtcars
dataset$carname <- row.names(mtcars)

gg_point <- ggplot(
  data = dataset,
  mapping = aes(
    x = wt,
    y = qsec,
    color = disp,
    tooltip = carname,
    data_id = carname
  )
) +
  geom_point_interactive(hover_nearest = TRUE, size = 11 / .pt) +
  theme_minimal(base_family = fonts$sans, base_size = 11)

x <- girafe(
  ggobj = gg_point,
  font_set = fonts
)

x
```

---

girafeOutput   *Create a girafe output element*

Description

Render a girafe within an application page.

Usage

```
girafeOutput(outputId, width = "100%", height = NULL)
```

Arguments

`outputId`	output variable to read the girafe from. Do not use special JavaScript characters such as a period . in the id, this would create a JavaScript error.
`width`	widget width, its default value is set so that the graphic can cover the entire available horizontal space.
`height`	widget height, its default value is NULL so that width adaptation is not restricted. The height will then be defined according to the width used and the aspect ratio. Only use a value for the height if you have a specific reason and want to strictly control the size.

Size control

If you want to control a fixed size, use `opts_sizing(rescale = FALSE)` and set the chart size with `girafe(width_svg=..., height_svg=...)`.

If you want the graphic to fit the available width, use `opts_sizing(rescale = TRUE)` and set the size of the graphic with `girafe(width_svg=..., height_svg=...)`, this size will define the aspect ratio.

---

girafe_class	*Add, remove or toggle CSS classes on girafe elements*

Description

These functions allow programmatic manipulation of CSS classes on SVG elements within a girafe output in Shiny applications. Elements are targeted by their `data-id`, `key-id`, or `theme-id` attributes.

Usage

```
girafe_class_add(
  session,
  id,
  class,
  data_id = NULL,
  key_id = NULL,
  theme_id = NULL
)

girafe_class_remove(
  session,
  id,
  class,
  data_id = NULL,
  key_id = NULL,
  theme_id = NULL
)
```

```
girafe_class_toggle(
  session,
  id,
  class,
  data_id = NULL,
  key_id = NULL,
  theme_id = NULL
)
```

Arguments

session	The Shiny session object.
id	The output id of the girafe element (the outputId used in girafeOutput()).
class	A non-empty character string of CSS class names to add, remove, or toggle.
data_id	A character vector of data-id values identifying the target elements.
key_id	A character vector of key-id values identifying the target elements.
theme_id	A character vector of theme-id values identifying the target elements.

Details

At least one of data_id, key_id, or theme_id must be provided.

These functions send a custom message to the JavaScript side, which applies the CSS class operation to all matching SVG elements within the girafe root node.

Examples

```
## Not run:
# In a Shiny server function:
girafe_class_add(session, "plot", "highlighted", data_id = "some_id")
girafe_class_remove(session, "plot", "highlighted", data_id = "some_id")
girafe_class_toggle(session, "plot", "highlighted", data_id = "some_id")

## End(Not run)
```

---

girafe_css   *CSS creation helper*

Description

It allows specifying individual styles for various SVG elements.

Usage

```
girafe_css(
  css,
  text = NULL,
  point = NULL,
  line = NULL,
  area = NULL,
  image = NULL
)
```

Arguments

css	The generic css style
text	Override style for text elements (svg:text)
point	Override style for point elements (svg:circle)
line	Override style for line elements (svg:line, svg:polyline)
area	Override style for area elements (svg:rect, svg:polygon, svg:path)
image	Override style for image elements (svg:image)

Value

css as scalar character

See Also

[girafe_css_bicolor()](), [girafe()]()

Examples

```
library(ggiraph)

girafe_css(
  css = "fill:orange;stroke:gray;",
  text = "stroke:none; font-size: larger",
  line = "fill:none",
  area = "stroke-width:3px",
  point = "stroke-width:3px",
  image = "outline:2px red"
)
```

---

girafe_css_bicolor   *Helper for a 'girafe' css string*

Description

It allows the creation of a css set of individual styles for animation of 'girafe' elements. The used model is based on a simple pattern that works *most of the time* for girafe hover effects and selection effects.

It sets properties based on a primary and a secondary color.

Usage

```
girafe_css_bicolor(primary = "orange", secondary = "gray")
```

Arguments

primary, secondary

colors used to define animations of fill and stroke properties with text, lines, areas, points and images in 'girafe' outputs.

See Also

[girafe_css()](), [girafe()]()

Examples

```
library(ggplot2)
library(ggiraph)

dat <- mtcars
dat$id <- "id"
dat$label <- "a line"
dat <- dat[order(dat$wt), ]

p <- ggplot(
  data = dat,
  mapping = aes(
    x = wt, y = mpg, data_id = id, tooltip = label)) +
  geom_line_interactive(color = "white", size  = .75,
                        hover_nearest = TRUE) +
  theme_dark() +
  theme(plot.background = element_rect(fill="black"),
        panel.background = element_rect(fill="black"),
        text = element_text(colour = "white"),
        axis.text = element_text(colour = "white")
        )

x <- girafe(
  ggobj = p,
```

```
  options = list(
    opts_hover(
      css = girafe_css_bicolor(
        primary = "yellow", secondary = "black"))
))
if (interactive()) print(x)
```

---

girafe_defaults   *Get girafe defaults formatting properties*

Description

The current formatting properties are automatically applied to every girafe you produce. These default values are returned by this function.

Usage

```
girafe_defaults(name = NULL)
```

Arguments

name   optional, option's name to return, one of 'fonts', 'opts_sizing', 'opts_tooltip',
                    'opts_hover', 'opts_hover_key', 'opts_hover_inv', 'opts_hover_theme', 'opts_selection',
                    'opts_selection_inv', 'opts_selection_key', 'opts_selection_theme', 'opts_zoom',
                    'opts_toolbar'.

Value

a list containing default values or an element selected with argument name.

See Also

Examples

```
girafe_defaults()
```

---

girafe_options   *Set girafe options*

Description

Defines the animation options related to a [girafe()](#) object.

Usage

```
girafe_options(x, ...)
```

Arguments

x   girafe object.

...   set of options defined by calls to opts_* functions or to sizingPolicy from html-
                         widgets (this won't have any effect within a shiny context).

library(htmlwidgets)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg_point = ggplot( data = dataset,
    mapping = aes(x = wt, y = qsec, color = disp,
    tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg_point)
x <- girafe_options(x = x,
    opts_tooltip(opacity = .7),
    opts_zoom(min = .5, max = 4),
    sizingPolicy(defaultWidth = "100%", defaultHeight = "300px"),
    opts_hover(css = "fill:red;stroke:orange;r:5pt;") )

if(interactive()){
  print(x)
}
```

```
guide_bins_interactive
```
Create interactive bins guide

Description

The guide is based on [ggplot2::guide_bins()](). See the documentation for that function for more
details.

Usage

```
guide_bins_interactive(...)
```

Arguments

`...`	arguments passed to base function.

Value

An interactive guide object.

Details for interactive scale and interactive guide functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they
can be scalar values or vectors, depending on the number of breaks (levels) and the type of the
guide used. The guides do not accept any interactive parameter directly, they receive them from the
scales.

When guide of type `legend`, `bins`, `colourbar` or `coloursteps` is used, it will be converted to a
[guide_legend_interactive()](), [guide_bins_interactive()](), [guide_colourbar_interactive()]()
or [guide_coloursteps_interactive()]() respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can
also be a named vector, where each name should correspond to the same break name. It can also be
defined as function that takes the breaks as input and returns a named or unnamed vector of values
as output.

For binned guides like `bins` and `coloursteps` the breaks include the label breaks and the limits.
The number of bins will be one less than the number of breaks and the interactive parameters can
be constructed for each bin separately (look at the examples). For `colourbar` guide in raster mode,
the breaks vector, is scalar 1 always, meaning the interactive parameters should be scalar too. For
`colourbar` guide in non-raster mode, the bar is drawn using rectangles, and the breaks are the
midpoints of each rectangle.

The interactive parameters here, give interactivity only to the key elements of the guide.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the rel-
evant theme elements or relevant guide arguments can be used. The `guide` arguments `title.theme`
and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to
that if they are not already), either directly or via the theme. See the element_*_interactive section
for more details.

)
x
```

---

guide_colourbar_interactive

Create interactive continuous colour bar guide

Description

The guide is based on `ggplot2::guide_colourbar()`. See the documentation for that function for more details.

Usage

```
guide_colourbar_interactive(...)

guide_colorbar_interactive(...)
```

Arguments

`...`	arguments passed to base function.

Value

An interactive guide object.

Details for interactive scale and interactive guide functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

When guide of type `legend`, `bins`, `colourbar` or `coloursteps` is used, it will be converted to a `guide_legend_interactive()`, `guide_bins_interactive()`, `guide_colourbar_interactive()` or `guide_coloursteps_interactive()` respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

For binned guides like `bins` and `coloursteps` the breaks include the label breaks and the limits. The number of bins will be one less than the number of breaks and the interactive parameters can

be constructed for each bin separately (look at the examples). For `colourbar` guide in raster mode, the breaks vector, is scalar 1 always, meaning the interactive parameters should be scalar too. For `colourbar` guide in non-raster mode, the bar is drawn using rectangles, and the breaks are the midpoints of each rectangle.

The interactive parameters here, give interactivity only to the key elements of the guide.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The `guide` arguments `title.theme` and `label.theme` can be defined as `element_text_interactive` (in fact, they will be converted to that if they are not already), either directly or via the theme. See the element_*_interactive section for more details.

init_girafe_defaults   *Re-init animation defaults options*

Description

Re-init all defaults options with the package defaults.

Usage

```
init_girafe_defaults()
```

See Also

Other girafe animation options: `girafe_defaults()`, `girafe_options()`, `opts_hover()`, `opts_selection()`,
`opts_sizing()`, `opts_toolbar()`, `opts_tooltip()`, `opts_zoom()`, `set_girafe_defaults()`

---

interactive_circle_grob

Create interactive circles grob

Description

The grob is based on `circleGrob()`. See the documentation for that function for more details.

Usage

```
interactive_circle_grob(...)
```

Arguments

`...`   arguments passed to base function, plus any of the interactive_parameters.

Value

An interactive grob object.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

girafe()

interactive_parameters

Interactive parameters

Description

Throughout ggiraph there are functions that add interactivity to ggplot plot elements. The user can control the various aspects of interactivity by supplying a special set of parameters to these functions.

Arguments

tooltip
: Tooltip text to associate with one or more elements. If this is supplied a tooltip is shown when the element is hovered. Plain text or html is supported.

    To use html markup it is advised to use `htmltools::HTML()` function in order to mark the text as html markup. If the text is not marked as html and no opening/closing tags were detected, then any existing newline characters (\r\n, \r and \n) are replaced with the <br/> tag.

onclick
: Javascript code to associate with one or more elements. This code will be executed when the element is clicked.

hover_css
: Individual css style associate with one or more elements. This css style is applied when the element is hovered and overrides the default style, set via `opts_hover()`, `opts_hover_key()` or `opts_hover_theme()`. It can also be constructed with `girafe_css()`, to give more control over the css for different element types (see `opts_hover()` note).

selected_css
: Individual css style associate with one or more elements. This css style is applied when the element is selected and overrides the default style, set via `opts_selection()`, `opts_selection_key()` or `opts_selection_theme()`. It can also be constructed with `girafe_css()`, to give more control over the css for different element types (see `opts_selection()` note).

data_id
: Identifier to associate with one or more elements. This is mandatory parameter if hover and selection interactivity is desired. Identifiers are available as reactive input values in Shiny applications.

tooltip_fill
: Color to use for tooltip background when `opts_tooltip()` use_fill is TRUE. Useful for setting the tooltip background color in `geom_text_interactive()` or `geom_label_interactive()`, when the geom text color may be the same as the tooltip text color.

hover_nearest
: Set to TRUE to apply the hover effect on the nearest element while moving the mouse. In this case it is mandatory to also set the data_id parameter

Details for interactive geom functions

The interactive parameters can be supplied with two ways:

- As aesthetics with the mapping argument (via `ggplot2::aes()`). In this way they can be mapped to data columns and apply to a set of geometries.

- As plain arguments into the geom_*_interactive function. In this way they can be set to a scalar value.

Details for annotate_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

Details for interactive scale and interactive guide functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

When guide of type legend, bins, colourbar or coloursteps is used, it will be converted to a guide_legend_interactive(), guide_bins_interactive(), guide_colourbar_interactive() or guide_coloursteps_interactive() respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

For binned guides like bins and coloursteps the breaks include the label breaks and the limits. The number of bins will be one less than the number of breaks and the interactive parameters can be constructed for each bin separately (look at the examples). For colourbar guide in raster mode, the breaks vector, is scalar 1 always, meaning the interactive parameters should be scalar too. For colourbar guide in non-raster mode, the bar is drawn using rectangles, and the breaks are the midpoints of each rectangle.

The interactive parameters here, give interactivity only to the key elements of the guide.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments title.theme and label.theme can be defined as element_text_interactive (in fact, they will be converted to that if they are not already), either directly or via the theme. See the element_*_interactive section for more details.

Details for element_*_interactive functions

The interactive parameters can be supplied as arguments in the relevant function and they should be scalar values.

For theme text elements (element_text_interactive()), the interactive parameters can also be supplied while setting a label value, via the ggplot2::labs() family of functions or when setting a scale/guide title or key label. Instead of setting a character value for the element, function label_interactive() can be used to define interactive parameters to go along with the label. When the parameters are supplied that way, they override the default values that are set at the theme via element_text_interactive() or via the guide's theme parameters.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

Custom interactive parameters

The argument `extra_interactive_params` can be passed to any of the *_interactive functions (geoms, grobs, scales, labeller, labels and theme elements), It should be a character vector of additional names to be treated as interactive parameters when evaluating the aesthetics. The values will eventually end up as attributes in the SVG elements of the output.

Intended only for expert use.

interactive_path_grob   *Create interactive path grob*

Description

The grob is based on [pathGrob()](). See the documentation for that function for more details.

Usage

```
interactive_path_grob(...)
```

Arguments

...   arguments passed to base function, plus any of the [interactive_parameters]().

Value

An interactive grob object.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

See Also

[girafe()]()

---

interactive_points_grob

Create interactive points grob

Description

The grob is based on [pointsGrob()](#). See the documentation for that function for more details.

Usage

```
interactive_points_grob(...)
```

Arguments

...   arguments passed to base function, plus any of the [interactive_parameters](#).

Value

An interactive grob object.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

interactive_parameters, girafe()

---

interactive_rect_grob   *Create interactive rectangle grob*

Description

The grob is based on [rectGrob()](). See the documentation for that function for more details.

Usage

```
interactive_rect_grob(...)
```

Arguments

...	arguments passed to base function, plus any of the interactive_parameters.

Value

An interactive grob object.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

See Also

girafe()

---

interactive_roundrect_grob

Create interactive rectangle grob

Description

The grob is based on roundrectGrob(). See the documentation for that function for more details.

Usage

```
interactive_roundrect_grob(...)
```

Arguments

...   arguments passed to base function, plus any of the interactive_parameters.

Value

An interactive grob object.

Details for interactive_*_grob functions

The interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors depending on params on base function.

See Also

[girafe()](#)

---

labeller_interactive *Construct interactive labelling specification for facet strips*

Description

This function is a wrapper around [ggplot2::labeller()](#) that allows the user to turn facet strip labels into interactive labels via [label_interactive()](#).

It requires that the [ggplot2::theme()](#)'s strip.text elements are defined as interactive theme elements via [element_text_interactive()](#), see details.

Usage

```
labeller_interactive(.mapping = NULL, ...)
```

Arguments

.mapping	set of aesthetic mappings created by [ggplot2::aes()](#) or [ggplot2::aes_()](#). It should provide mappings for any of the [interactive_parameters](#). In addition it understands a label parameter for creating a new label text.
...	arguments passed to base function [ggplot2::labeller()](#)

Details

The aesthetics set provided via .mapping is evaluated against the data provided by the ggplot2 facet. This means that the variables for each facet are available for using inside the aesthetic mappings. In addition the .label variable provides access to the produced label. See the examples.

The plot's theme is required to have the strip texts as interactive text elements. This involves strip.text or individually strip.text.x and strip.text.y: theme(strip.text.x = element_text_interactive()) theme(strip.text.y = element_text_interactive())

See Also

[ggplot2::labeller()](#), [label_interactive()](#), [ggplot2::labellers](#)

Examples

```
# use interactive labeller
library(ggplot2)
library(ggiraph)

p1 <- ggplot(mtcars, aes(x = mpg, y = wt)) +
  geom_point_interactive(aes(tooltip = row.names(mtcars)))

# Always remember to set the theme's strip texts as interactive
# no need to set any interactive parameters, they'll be assigned from the labels
p1 <- p1 +
  theme(
    strip.text.x = element_text_interactive(),
    strip.text.y = element_text_interactive()
  )

# simple facet
p <- p1 +
  facet_wrap_interactive(
    vars(gear),
    labeller = labeller_interactive(aes(tooltip = paste("Gear:", gear)))
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# With two vars. When the .multi_line labeller argument is TRUE (default),
# supply a different labeller for each var
p <- p1 +
  facet_wrap_interactive(
    vars(gear, vs),
    labeller = labeller_interactive(
      gear = labeller_interactive(aes(tooltip = paste("Gear:", gear))),
      vs = labeller_interactive(aes(tooltip = paste("VS:", vs)))
    )
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# When the .multi_line argument is FALSE, the labels are joined and
# the same happens with the data, so we can refer to both variables in the aesthetics!
p <- p1 +
  facet_wrap_interactive(
    vars(gear, vs),
    labeller = labeller_interactive(
      aes(tooltip = paste0("Gear: ", gear, "\nVS: ", vs)),
      .multi_line = FALSE
    )
  )
```

```
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# Example with facet_grid:
p <- p1 +
  facet_grid_interactive(
    vs + am ~ gear,
    labeller = labeller(
      gear = labeller_interactive(aes(
        tooltip = paste("gear:", gear),
        data_id = paste0("gear_", gear)
      )),
      vs = labeller_interactive(aes(
        tooltip = paste("VS:", vs),
        data_id = paste0("vs_", vs)
      )),
      am = labeller_interactive(aes(
        tooltip = paste("AM:", am),
        data_id = paste0("am_", am)
      ))
    )
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# Same with .rows and .cols and .multi_line = FALSE
p <- p1 +
  facet_grid_interactive(
    vs + am ~ gear,
    labeller = labeller(
      .cols = labeller_interactive(
        .mapping = aes(tooltip = paste("gear:", gear))
      ),
      .rows = labeller_interactive(
        aes(tooltip = paste0("VS: ", vs, "\nAM: ", am)),
        .multi_line = FALSE
      )
    )
  )
x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
}

# a more complex example
p2 <- ggplot(msleep, aes(x = sleep_total, y = awake)) +
  geom_point_interactive(aes(tooltip = name)) +
  theme(
    strip.text.x = element_text_interactive(),
```

```
      strip.text.y = element_text_interactive()
  )

# character vector as lookup table
conservation_status <- c(
  cd = "Conservation Dependent",
  en = "Endangered",
  lc = "Least concern",
  nt = "Near Threatened",
  vu = "Vulnerable",
  domesticated = "Domesticated"
)

# function to capitalize a string
capitalize <- function(x) {
  substr(x, 1, 1) <- toupper(substr(x, 1, 1))
  x
}

# function to cut a string and append an ellipsis
cut_str <- function(x, width = 10) {
  ind <- !is.na(x) & nchar(x) > width
  x[ind] <- paste0(substr(x[ind], 1, width), "...")
  x
}

replace_nas <- function(x) {
  ifelse(is.na(x), "Not available", x)
}

# in this example we use the '.label' variable to access the produced label
# and we set the 'label' aesthetic to modify the label
p <- p2 +
  facet_grid_interactive(
    vore ~ conservation,
    labeller = labeller(
      vore = labeller_interactive(
        aes(tooltip = paste("Vore:", replace_nas(.label))),
        .default = capitalize
      ),
      conservation = labeller_interactive(
        aes(
          tooltip = paste("Conservation:\n", replace_nas(.label)),
          label = cut_str(.label, 3)
        ),
        .default = conservation_status
      )
    )
  )

x <- girafe(ggobj = p)
if (interactive()) {
  print(x)
```

```
      }
```

---

label_interactive   *Create an interactive label*

Description

This function returns an object that can be used as a label via the `ggplot2::labs()` family of functions or when setting a scale/guide name/title or key label. It passes the interactive parameters to a theme element created via `element_text_interactive()` or via an interactive guide.

Usage

```
label_interactive(label, ...)
```

Arguments

label   The text for the label (scalar character)

...   any of the interactive_parameters.

Value

an interactive label object

See Also

interactive_parameters, `labeller_interactive()`

Examples

```
library(ggplot2)
library(ggiraph)

gg_jitter <- ggplot(
  mpg, aes(cyl, hwy, group = cyl)) +
  geom_boxplot() +
  labs(title =
          label_interactive(
            "title",
            data_id = "id_title",
            onclick = "alert(\"title\")",
            tooltip = "title" )
  ) +
  theme(plot.title = element_text_interactive())

x <- girafe(ggobj = gg_jitter)
if( interactive() ) print(x)
```

---

match_family   *Find best family match with systemfonts*

Description

match_family() returns the best font family match.

Usage

```
match_family(font = "sans", bold = TRUE, italic = TRUE, debug = NULL)
```

Arguments

font	family or face to match.
bold	Wheter to match a font featuring a bold face.
italic	Wheter to match a font featuring an italic face.
debug	deprecated

See Also

Other functions for font management: [validated_fonts](#)()

Examples

```
match_family("sans")
match_family("serif")
```

---

opts_hover   *Hover effect settings*

Description

Allows customization of the rendering of graphic elements when the user hovers over them with the cursor (mouse pointer). Use opts_hover for interactive geometries in panels, opts_hover_key for interactive scales/guides and opts_hover_theme for interactive theme elements. Use opts_hover_inv for the effect on the rest of the geometries, while one is hovered (inverted operation).

Usage

```
opts_hover(
  css = NULL,
  reactive = FALSE,
  nearest_distance = NULL,
  linked = FALSE
)

opts_hover_inv(css = NULL)

opts_hover_key(css = NULL, reactive = FALSE)

opts_hover_theme(css = NULL, reactive = FALSE)
```

Arguments

css   css to associate with elements when they are hovered. It must be a scalar char-
                   acter. It can also be constructed with [girafe_css()](#), to give more control over
                   the css for different element types.

reactive   if TRUE, in Shiny context, hovering will set Shiny input values.

nearest_distance
                   a scalar positive number defining the maximum distance to use when using
                   the hover_nearest [interactive parameter](#) feature. By default (NULL) it's set
                   to Infinity which means that there is no distance limit. Setting it to 50, for
                   example, it will hover the nearest element that has at maximum 50 SVG units
                   (pixels) distance from the mouse cursor.

linked   if TRUE, hovering a legend/guide element (key-id) will also highlight the cor-
                   responding geometry elements (data-id) and vice versa.

Note

IMPORTANT: When applying a fill style with the css argument, be aware that the browser's
CSS engine will apply it also to line elements, if there are any that use the hovering feature. This
will cause an undesired effect.

To overcome this, supply the argument css using [girafe_css()](#), in order to set the fill style only
for the desired elements.

[opts_selection()](#), [opts_sizing()](#), [opts_toolbar()](#), [opts_tooltip()](#), [opts_zoom()](#), [set_girafe_defaults()](#)

Examples

```
library(ggplot2)

dataset <- mtcars
```

```
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
                tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
  opts_hover(css = "fill:wheat;stroke:orange;r:5pt;") )
if( interactive() ) print(x)
```

---

opts_selection   *Selection effect settings*

Description

Allows customization of the rendering of selected graphic elements. Use `opts_selection` for inter-
active geometries in panels, `opts_selection_key` for interactive scales/guides and `opts_selection_theme`
for interactive theme elements. Use `opts_selection_inv` for the effect on the rest of the geome-
tries, while some are selected (inverted operation).

Usage

```
opts_selection(
  css = NULL,
  type = c("multiple", "single", "none"),
  only_shiny = TRUE,
  selected = character(0),
  linked = FALSE
)

opts_selection_inv(css = NULL)

opts_selection_key(
  css = NULL,
  type = c("single", "multiple", "none"),
  only_shiny = TRUE,
  selected = character(0)
)

opts_selection_theme(
  css = NULL,
  type = c("single", "multiple", "none"),
  only_shiny = TRUE,
  selected = character(0)
)
```

Arguments

css
: css to associate with elements when they are selected. It must be a scalar character. It can also be constructed with [girafe_css()](#), to give more control over the css for different element types.

type
: selection mode ("single", "multiple", "none") when widget is in a Shiny application.

only_shiny
: disable selections when not running within a Shiny application. Defaults to TRUE because selection is primarily designed for Shiny interactivity, where selected elements can be captured as reactive values. Set to FALSE only to demonstrate the selection/lasso feature in standalone HTML pages (e.g. in documentation examples or R Markdown output).

selected
: character vector, id to be selected when the graph will be initialized.

linked
: if TRUE, selecting a legend/guide element (key-id) will also select the corresponding geometry elements (data-id) and vice versa.

Note

IMPORTANT: When applying a fill style with the css argument, be aware that the browser's CSS engine will apply it also to line elements, if there are any that use the selection feature. This will cause an undesired effect.

To overcome this, supply the argument css using [girafe_css()](#), in order to set the fill style only for the desired elements.

Examples

```
library(ggplot2)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
                tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
  opts_selection(type = "multiple", only_shiny = FALSE,
    css = "fill:red;stroke:gray;r:5pt;") )
if( interactive() ) print(x)
```

---

opts_sizing   *Girafe sizing settings*

Description

Allows customization of the svg style sizing

Usage

```
opts_sizing(rescale = TRUE, width = 1)
```

Arguments

rescale   If FALSE, graphic will not be resized and the dimensions are exactly those of
                the svg. If TRUE the graphic will be resize to fit its container

width   widget width ratio (0 < width <= 1).

`opts_hover()`, `opts_selection()`, `opts_toolbar()`, `opts_tooltip()`, `opts_zoom()`, `set_girafe_defaults()`

Examples

```
library(ggplot2)

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
                tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
  opts_sizing(rescale = FALSE) )
if( interactive() ) print(x)
```

---

opts_toolbar *Toolbar settings*

Description

Allows customization of the toolbar

Usage

```
opts_toolbar(
 position = c("topright", "top", "bottom", "topleft", "bottomleft", "bottomright"),
 saveaspng = TRUE,
 pngname = "diagram",
 tooltips = NULL,
 hidden = NULL,
 fixed = FALSE,
 delay_mouseover = 200,
 delay_mouseout = 500
)
```

Arguments

position	Position of the toolbar relative to the plot. One of 'top', 'bottom', 'topleft', 'topright', 'bottomleft', 'bottomright'
saveaspng	Show (TRUE) or hide (FALSE) the 'download png' button.
pngname	The default basename (without .png extension) to use for the png file.
tooltips	A named list with tooltip labels for the buttons, for adapting to other language. Passing NULL will use the default tooltips:
	list(lasso_select = 'lasso selection', lasso_deselect = 'lasso deselection', zoom_on = 'activate pan/zoom', zoom_off = 'deactivate pan/zoom', zoom_rect = 'zoom with rectangle', zoom_reset = 'reset pan/zoom', saveaspng = 'download png', fullscreen = 'fullscreen')
hidden	A character vector with the names of the buttons or button groups to be hidden from the toolbar. This allows full customization of which buttons appear.
	Valid button groups: 'selection', 'zoom', 'misc'
	Valid button names: 'lasso_select', 'lasso_deselect', 'zoom_onoff', 'zoom_rect', 'zoom_reset', 'saveaspng', 'fullscreen'
fixed	if FALSE (default), the toolbar will float above the graphic, if TRUE, the toolbar will be fixed and always visible.
delay_mouseover	
	The duration in milliseconds of the transition associated with toolbar display.
delay_mouseout	The duration in milliseconds of the transition associated with toolbar end of display.

Note

saveaspng relies on JavaScript promises, so any browsers that don't natively support the standard
Promise object will need to have a polyfill (e.g. Internet Explorer with version less than 11 will
need it).

      position = "top",
      hidden = c("selection", "zoom_rect", "saveaspng")
    )
  )
)
if (interactive()) print(x)
```

---

opts_tooltip   *Tooltip settings*

Description

Settings to be used with girafe() for tooltip customisation.

Usage

```
opts_tooltip(
  css = NULL,
  offx = 10,
  offy = 0,
  use_cursor_pos = TRUE,
  opacity = 0.9,
  use_fill = FALSE,
  use_stroke = FALSE,
  delay_mouseover = 200,
  delay_mouseout = 500,
  placement = c("auto", "doc", "container"),
  zindex = 9999
)
```

Arguments

css	extra css (added to position: absolute;pointer-events: none;) used to customize tooltip area.
offx, offy	tooltip x and y offset
use_cursor_pos	should the cursor position be used to position tooltip (in addition to offx and offy). Setting to TRUE will have no effect in the RStudio browser windows.
opacity	tooltip background opacity

use_fill, use_stroke

                logical, use fill and stroke properties to color tooltip.

delay_mouseover

                The duration in milliseconds of the transition associated with tooltip display.

delay_mouseout   The duration in milliseconds of the transition associated with tooltip end of display.

placement   Defines the container used for the tooltip element. It can be one of "auto" (default), "doc" or "container".

- doc: the host document's body is used as tooltip container. The tooltip may cover areas outside of the svg graphic.
- container: the svg container is used as tooltip container. In this case the tooltip content may wrap to fit inside the svg bounds. It will also inherit the CSS styles and transforms applied to the parent containers (like scaling in a slide presentation).
- auto: This is the default, ggiraph choses the best option according to use cases. Usually it redirects to "doc", however in a *xaringan* context, it redirects to "container".

zindex   tooltip css z-index, default to 999.

dataset <- mtcars
dataset$carname = row.names(mtcars)

gg <- ggplot(
  data = dataset,
  mapping = aes(x = wt, y = qsec, color = disp,
                tooltip = carname, data_id = carname) ) +
  geom_point_interactive() + theme_minimal()

x <- girafe(ggobj = gg)
x <- girafe_options(x,
  opts_tooltip(opacity = .7,
    offx = 20, offy = -10,
    use_fill = TRUE, use_stroke = TRUE,
    delay_mouseout = 1000) )
if( interactive() ) print(x)
```

opts_zoom   *Zoom settings*

Description

Allows customization of the zoom.

Usage

```
opts_zoom(min = 1, max = 1, duration = 300, default_on = FALSE)
```

Arguments

min	minimum zoom factor
max	maximum zoom factor
duration	duration of the zoom transitions, in milliseconds
default_on	if TRUE, pan/zoom will be activated by default when the plot is rendered

```

---

renderGirafe   *Reactive version of girafe*

Description

Makes a reactive version of girafe object for use in Shiny.

Usage

```
renderGirafe(expr, env = parent.frame(), quoted = FALSE, outputArgs = list())
```

Arguments

expr   An expression that returns a girafe() object.

env   The environment in which to evaluate expr.

quoted   Is expr a quoted expression

outputArgs   A list of arguments to be passed through to the implicit call to girafeOutput()
                when renderGirafe is used in an interactive R Markdown document.

---

run_girafe_example   *Run shiny examples and see corresponding code*

Description

Run shiny examples and see corresponding code

Usage

```
run_girafe_example(name = "crimes")
```

Arguments

name   an application name, one of cars, click_scale, crimes, DT, dynamic_ui, iris,
                maps and modal.

---

scale_alpha_interactive

Create interactive scales for alpha transparency

Description

These scales are based on `ggplot2::scale_alpha()`, `ggplot2::scale_alpha_continuous()`, `ggplot2::scale_alpha_discrete()`, `ggplot2::scale_alpha_binned()`, `ggplot2::scale_alpha_ordinal()`, `ggplot2::scale_alpha_date()`, `ggplot2::scale_alpha_datetime()`. See the documentation for those functions for more details.

Usage

```
scale_alpha_interactive(...)

scale_alpha_continuous_interactive(...)

scale_alpha_discrete_interactive(...)

scale_alpha_binned_interactive(...)

scale_alpha_ordinal_interactive(...)

scale_alpha_date_interactive(...)

scale_alpha_datetime_interactive(...)
```

Arguments

`...`	arguments passed to base function, plus any of the interactive_parameters.

Value

An interactive scale object.

Details for interactive scale and interactive guide functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

When guide of type `legend`, `bins`, `colourbar` or `coloursteps` is used, it will be converted to a `guide_legend_interactive()`, `guide_bins_interactive()`, `guide_colourbar_interactive()` or `guide_coloursteps_interactive()` respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be

defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

For binned guides like bins and coloursteps the breaks include the label breaks and the limits. The number of bins will be one less than the number of breaks and the interactive parameters can be constructed for each bin separately (look at the examples). For colourbar guide in raster mode, the breaks vector, is scalar 1 always, meaning the interactive parameters should be scalar too. For colourbar guide in non-raster mode, the bar is drawn using rectangles, and the breaks are the midpoints of each rectangle.

The interactive parameters here, give interactivity only to the key elements of the guide.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments title.theme and label.theme can be defined as element_text_interactive (in fact, they will be converted to that if they are not already), either directly or via the theme. See the element_*_interactive section for more details.

---

scale_shape_interactive

Create interactive scales for shapes

Description

These scales are based on [ggplot2::scale_shape()](#), [ggplot2::scale_shape_continuous()](#), [ggplot2::scale_shape_discrete()](#), [ggplot2::scale_shape_binned()](#) and [ggplot2::scale_shape_ordinal()](#). See the documentation for those functions for more details.

Usage

```
scale_shape_interactive(...)

scale_shape_continuous_interactive(...)

scale_shape_discrete_interactive(...)

scale_shape_binned_interactive(...)

scale_shape_ordinal_interactive(...)
```

Arguments

`...`	arguments passed to base function, plus any of the [interactive_parameters](#).

Value

An interactive scale object.

Details for interactive scale and interactive guide functions

For scales, the interactive parameters can be supplied as arguments in the relevant function and they can be scalar values or vectors, depending on the number of breaks (levels) and the type of the guide used. The guides do not accept any interactive parameter directly, they receive them from the scales.

When guide of type legend, bins, colourbar or coloursteps is used, it will be converted to a [guide_legend_interactive()](), [guide_bins_interactive()](), [guide_colourbar_interactive()]() or [guide_coloursteps_interactive()]() respectively, if it's not already.

The length of each scale interactive parameter vector should match the length of the breaks. It can also be a named vector, where each name should correspond to the same break name. It can also be defined as function that takes the breaks as input and returns a named or unnamed vector of values as output.

For binned guides like bins and coloursteps the breaks include the label breaks and the limits. The number of bins will be one less than the number of breaks and the interactive parameters can be constructed for each bin separately (look at the examples). For colourbar guide in raster mode, the breaks vector, is scalar 1 always, meaning the interactive parameters should be scalar too. For colourbar guide in non-raster mode, the bar is drawn using rectangles, and the breaks are the midpoints of each rectangle.

The interactive parameters here, give interactivity only to the key elements of the guide.

To provide interactivity to the rest of the elements of a guide, (title, labels, background, etc), the relevant theme elements or relevant guide arguments can be used. The guide arguments title.theme and label.theme can be defined as element_text_interactive (in fact, they will be converted to that if they are not already), either directly or via the theme. See the element_*_interactive section for more details.

---

scale_size_interactive

Create interactive scales for area or radius

Description

These scales are based on [ggplot2::scale_size()](), [ggplot2::scale_size_area()](), [ggplot2::scale_size_continuous](), [ggplot2::scale_size_discrete()](), [ggplot2::scale_size_binned()](), [ggplot2::scale_size_binned_area()](), [ggplot2::scale_size_date()](), [ggplot2::scale_size_datetime()](), [ggplot2::scale_size_ordinal()]() and [ggplot2::scale_radius()](). See the documentation for those functions for more details.

Usage

```
scale_size_interactive(...)

scale_size_area_interactive(...)

scale_size_continuous_interactive(...)

scale_size_discrete_interactive(...)

scale_size_binned_interactive(...)

scale_size_binned_area_interactive(...)

scale_size_date_interactive(...)

scale_size_datetime_interactive(...)

scale_size_ordinal_interactive(...)

scale_radius_interactive(...)
```

Arguments

`...`	arguments passed to base function, plus any of the interactive_parameters.

Value

An interactive scale object.

set_girafe_defaults   *Modify defaults girafe animation options*

Description

girafe animation options (see [girafe_defaults()](#)) are automatically applied to every girafe you produce. Use set_girafe_defaults() to override them. Use init_girafe_defaults() to re-init all values with the package defaults.

Usage

```
set_girafe_defaults(
  fonts = NULL,
  opts_sizing = NULL,
  opts_tooltip = NULL,
  opts_hover = NULL,
  opts_hover_key = NULL,
  opts_hover_inv = NULL,
```

```
    opts_hover_theme = NULL,
    opts_selection = NULL,
    opts_selection_inv = NULL,
    opts_selection_key = NULL,
    opts_selection_theme = NULL,
    opts_zoom = NULL,
    opts_toolbar = NULL
)
```

Arguments

fonts	default values for fonts, see argument fonts of [dsvg()](#) function.
opts_sizing	default values for [opts_sizing()](#) used in argument options of girafe() function.
opts_tooltip	default values for [opts_tooltip()](#) used in argument options of girafe() function.
opts_hover	default values for [opts_hover()](#) used in argument options of girafe() function.
opts_hover_key	default values for [opts_hover_key()](#) used in argument options of girafe() function.
opts_hover_inv	default values for [opts_hover_inv()](#) used in argument options of girafe() function.
opts_hover_theme	
	default values for [opts_hover_theme()](#) used in argument options of girafe() function.
opts_selection	default values for [opts_selection()](#) used in argument options of girafe() function.
opts_selection_inv	
	default values for [opts_selection_inv()](#) used in argument options of girafe() function.
opts_selection_key	
	default values for [opts_selection_key()](#) used in argument options of girafe() function.
opts_selection_theme	
	default values for [opts_selection_theme()](#) used in argument options of girafe() function.
opts_zoom	default values for [opts_zoom()](#) used in argument options of girafe() function.
opts_toolbar	default values for [opts_toolbar()](#) used in argument options of girafe() function.

Other girafe animation options: [girafe_defaults()](#), [girafe_options()](#), [init_girafe_defaults()](#), [opts_hover()](#), [opts_selection()](#), [opts_sizing()](#), [opts_toolbar()](#), [opts_tooltip()](#), [opts_zoom()](#)

Examples

```
library(ggplot2)

set_girafe_defaults(
  opts_hover = opts_hover(css = "r:10px;"),
  opts_hover_inv = opts_hover_inv(),
  opts_sizing = opts_sizing(rescale = FALSE, width = .8),
  opts_tooltip = opts_tooltip(opacity = .7,
                              offx = 20, offy = -10,
                              use_fill = TRUE, use_stroke = TRUE,
                              delay_mouseout = 1000),
  opts_toolbar = opts_toolbar(position = "top", saveaspng = FALSE),
  opts_zoom = opts_zoom(min = .8, max = 7)
)

init_girafe_defaults()
```

---

validated_fonts   *List of validated default fonts*

Description

Validates and possibly modifies the fonts to be used as default value in a graphic according to the fonts available on the machine. It processes elements named "sans", "serif", "mono" and "symbol".

Default font resolution is delegated to `gdtools::font_set_liberation()`, which uses Liberation fonts (bundled by 'fontquiver', SIL Open Font License) for reproducible offline output.

Usage

```
validated_fonts(fonts = list())
```

Arguments

fonts   Named list of font names to be aliased with fonts installed on your system. If unspecified, the defaults from `gdtools::font_set_liberation()` are used.

Value

a named list of validated font family names

See Also

`girafe()`, `dsvg()`

Other functions for font management: `match_family()`

Examples

```
validated_fonts()
```
